}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Privacy a
nd utility: this is tricky contact which requires application of a multidimensional observation of federate
d recommendation systems. The privacy mechanisms cannot be simply judged in terms of their efficiency becau
se it is as well crucial to deeply examine them in the area of fairness. It has to target the assurance tha
t privacy protecting practices are favourable to all the categories of user, regardless of the extent of th
eir involvement, and the depth of information they consume no matter how minimal. This is essential in maki
ng sure that no cases of over-benefits or wrongful harming of some groups of users or organisations are pre
sent. In other words, the challenge lies in ensuring that the privacy assurance is provided, and at the sam
e time, the utility and equity of recommendations are not undermined to the stakeholders of the federated e
cosystem. (M. Ali et al., 2025; Arafat, 2025a; Arcolezi et al., 2025a; Baumgartner et al., 2024; Choudhury

}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Privacy a
nd utility: this is tricky contact which requires application of a multidimensional observation of federate
d recommendation systems. The privacy mechanisms cannot be simply judged in terms of their efficiency becau
se it is as well crucial to deeply examine them in the area of fairness. It has to target the assurance tha
t privacy protecting practices are favourable to all the categories of user, regardless of the extent of th
eir involvement, and the depth of information they consume no matter how minimal. This is essential in maki
ng sure that no cases of over-benefits or wrongful harming of some groups of users or organisations are pre
sent. In other words, the challenge lies in ensuring that the privacy assurance is provided, and at the sam
e time, the utility and equity of recommendations are not undermined to the stakeholders of the federated e
cosystem. (M. Ali et al., 2025; Arafat, 2025a; Arcolezi et al., 2025a; Baumgartner et al., 2024; Choudhury

}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Privacy a
nd utility: this is tricky contact which requires application of a multidimensional observation of federate
d recommendation systems. The privacy mechanisms cannot be simply judged in terms of their efficiency becau
se it is as well crucial to deeply examine them in the area of fairness. It has to target the assurance tha
t privacy protecting practices are favourable to all the categories of user, regardless of the extent of th
eir involvement, and the depth of information they consume no matter how minimal. This is essential in maki
ng sure that no cases of over-benefits or wrongful harming of some groups of users or organisations are pre
sent. In other words, the challenge lies in ensuring that the privacy assurance is provided, and at the sam
e time, the utility and equity of recommendations are not undermined to the stakeholders of the federated e
cosystem. (M. Ali et al., 2025; Arafat, 2025a; Arcolezi et al., 2025a; Baumgartner et al., 2024; Choudhury

}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Privacy a
nd utility: this is tricky contact which requires application of a multidimensional observation of federate
d recommendation systems. The privacy mechanisms cannot be simply judged in terms of their efficiency becau
se it is as well crucial to deeply examine them in the area of fairness. It has to target the assurance tha

t privacy protecting practices are favourable to all the categories of user, regardless of the extent of th
eir involvement, and the depth of information they consume no matter how minimal. This is essential in maki
ng sure that no cases of over-benefits or wrongful harming of some groups of users or organisations are pre
sent. In other words, the challenge lies in ensuring that the privacy assurance is provided, and at the sam
e time, the utility and equity of recommendations are not undermined to the stakeholders of the federated e
cosystem. (M. Ali et al., 2025; Arafat, 2025a; Arcolezi et al., 2025a; Baumgartner et al., 2024; Choudhury

}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Privacy a
nd utility: this is tricky contact which requires application of a multidimensional observation of federate
d recommendation systems. The privacy mechanisms cannot be simply judged in terms of their efficiency becau
se it is as well crucial to deeply examine them in the area of fairness. It has to target the assurance tha
t privacy protecting practices are favourable to all the categories of user, regardless of the extent of th
eir involvement, and the depth of information they consume no matter how minimal. This is essential in maki
ng sure that no cases of over-benefits or wrongful harming of some groups of users or organisations are pre
sent. In other words, the challenge lies in ensuring that the privacy assurance is provided, and at the sam
e time, the utility and equity of recommendations are not undermined to the stakeholders of the federated e
cosystem. (M. Ali et al., 2025; Arafat, 2025a; Arcolezi et al., 2025a; Baumgartner et al., 2024; Choudhury

}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Privacy a
nd utility: this is tricky contact which requires application of a multidimensional observation of federate
d recommendation systems. The privacy mechanisms cannot be simply judged in terms of their efficiency becau
se it is as well crucial to deeply examine them in the area of fairness. It has to target the assurance tha
t privacy protecting practices are favourable to all the categories of user, regardless of the extent of th
eir involvement, and the depth of information they consume no matter how minimal. This is essential in maki
ng sure that no cases of over-benefits or wrongful harming of some groups of users or organisations are pre
sent. In other words, the challenge lies in ensuring that the privacy assurance is provided, and at the sam
e time, the utility and equity of recommendations are not undermined to the stakeholders of the federated e
cosystem. (M. Ali et al., 2025; Arafat, 2025a; Arcolezi et al., 2025a; Baumgartner et al., 2024; Choudhury

The privacy mechanisms cannot be simply judged in terms of their efficiency because it is as well crucial to deeply examine them in the area of fairness. It has to target the assurance that privacy protecting practices are favourable to all the categories of user, regardless of the extent of their involvement, and the depth of information they consume no matter how minimal. This is essential in making sure that no cases of over-benefits or wrongful harming of some groups of users or organisations are present. In other words, the challenge lies in ensuring that the privacy assurance is provided, and at the same time, the utility and equity of recommendations are not undermined to the stakeholders of the federated ecosystem. The privacy mechanisms cannot be simply judged in terms of their efficiency because it is as well crucial to deeply examine them in the area of fairness. It has to target the assurance that privacy protecting practices are favourable to all the categories of user, regardless of the extent of their involvement, and the depth of information they consume no matter how minimal. This is essential in making sure that no cases of over-benefits or wrongful harming of some groups of users or organisations are present. In other words, the challenge lies in ensuring that the privacy assurance is provided, and at the same time, the utility and equity of recommendations are not undermined to the stakeholders of the federated e

"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} To s
uccessfully go through such challenges, adaptive privacy mechanism must be used. Unlike with the applicatio
n of the static technique where privacy budget is equally applied to everyone participating in the system,
the adaptive mechanisms are developed or modelled similarly, in that they are able to dynamically adjust pr
ivacy settings in response to real-time system feedback and learned performance deviations. Such processes
are constantly monitoring the privacy and utility trade-offs, which are evolving, to enable the system to m
aximize the privacy settings of individual players or groups. An example of this is that, in case one parti
cular entity turns out to be particularly affected by the noise of privacy, then the adaptive mechanism can
 be used to ensure that they have a lower appropriate privacy budget so that their accuracy of recommendati
ons are not impaired unintentionally. Conversely, the participants possessing a more abundant data can be c
alibrated through the mechanism of noise with a lower likelihood of increasing the privacy paranoia that wi
ll unreasonably reduce utility. (Arcolezi et al., 2025b; Cao et al., 2019; Farokhi, 2024; Gao et al., 2019;

uccessfully go through such challenges, adaptive privacy mechanism must be used. Unlike with the applicatio
n of the static technique where privacy budget is equally applied to everyone participating in the system,
the adaptive mechanisms are developed or modelled similarly, in that they are able to dynamically adjust pr
ivacy settings in response to real-time system feedback and learned performance deviations. Such processes
are constantly monitoring the privacy and utility trade-offs, which are evolving, to enable the system to m
aximize the privacy settings of individual players or groups. An example of this is that, in case one parti
cular entity turns out to be particularly affected by the noise of privacy, then the adaptive mechanism can
 be used to ensure that they have a lower appropriate privacy budget so that their accuracy of recommendati
ons are not impaired unintentionally. Conversely, the participants possessing a more abundant data can be c
alibrated through the mechanism of noise with a lower likelihood of increasing the privacy paranoia that wi
ll unreasonably reduce utility. (Arcolezi et al., 2025b; Cao et al., 2019; Farokhi, 2024; Gao et al., 2019;

"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} To s
uccessfully go through such challenges, adaptive privacy mechanism must be used. Unlike with the applicatio
n of the static technique where privacy budget is equally applied to everyone participating in the system,
the adaptive mechanisms are developed or modelled similarly, in that they are able to dynamically adjust pr
ivacy settings in response to real-time system feedback and learned performance deviations. Such processes
are constantly monitoring the privacy and utility trade-offs, which are evolving, to enable the system to m

```
aximize the privacy settings of individual players or groups. An example of this is that, in case one parti
cular entity turns out to be particularly affected by the noise of privacy, then the adaptive mechanism can
 be used to ensure that they have a lower appropriate privacy budget so that their accuracy of recommendati
ons are not impaired unintentionally. Conversely, the participants possessing a more abundant data can be c
alibrated through the mechanism of noise with a lower likelihood of increasing the privacy paranoia that wi
ll unreasonably reduce utility. (Arcolezi et al., 2025b; Cao et al., 2019; Farokhi, 2024; Gao et al., 2019;

"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} To successfully go through such challenges, adaptive privacy mechanism must be used. Unlike with the application of the static technique where privacy budget is equally applied to everyone participating in the system, the adaptive mechanisms are developed or modelled similarly, in that they are able to dynamically adjust privacy settings in response to real-time system feedback and learned performance deviations. Such processes are constantly monitoring the privacy and utility trade-offs, which are evolving, to enable the system to maximize the privacy settings of individual players or groups. An example of this is that, in case one particular entity turns out to be particularly affected by the noise of privacy, then the adaptive mechanism can

be used to ensure that they have a lower appropriate privacy budget so that their accuracy of recommendations are not impaired unintentionally. Conversely, the participants possessing a more abundant data can be calibrated through the mechanism of noise with a lower likelihood of increasing the privacy paranoia that will unreasonably reduce utility. Unlike with the application of the static technique where privacy budget is equally applied to everyone participating in the system, the adaptive mechanisms are developed or modelled similarly, in that they are able to dynamically adjust privacy settings in response to real-time system feedback and learned performance deviations. Such processes are constantly monitoring the privacy and utility trade-offs, which are evolving, to enable the system to maximize the privacy settings of individual players or groups. An example of this is that, in case one particular entity turns out to be particularly affected by the noise of privacy, then the adaptive mechanism can be used to ensure that they have a lower appropriate privacy budget so that their accuracy of recommendati

```
ons are not impaired unintentionally. Conversely, the participants possessing a more abundant data can be c
alibrated through the mechanism of noise with a lower likelihood of increasing the privacy paranoia that wi
ll unreasonably reduce utility. (Arcolezi et al., 2025b; Cao et al., 2019; Farokhi, 2024; Gao et al., 2019;

"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} To s
uccessfully go through such challenges, adaptive privacy mechanism must be used. Unlike with the applicatio
n of the static technique where privacy budget is equally applied to everyone participating in the system,
the adaptive mechanisms are developed or modelled similarly, in that they are able to dynamically adjust pr
ivacy settings in response to real-time system feedback and learned performance deviations. Such processes
are constantly monitoring the privacy and utility trade-offs, which are evolving, to enable the system to m
aximize the privacy settings of individual players or groups. An example of this is that, in case one parti
cular entity turns out to be particularly affected by the noise of privacy, then the adaptive mechanism can
 be used to ensure that they have a lower appropriate privacy budget so that their accuracy of recommendati
ons are not impaired unintentionally. Conversely, the participants possessing a more abundant data can be c
alibrated through the mechanism of noise with a lower likelihood of increasing the privacy paranoia that wi
ll unreasonably reduce utility. (Arcolezi et al., 2025b; Cao et al., 2019; Farokhi, 2024; Gao et al., 2019;

are constantly monitoring the privacy and utility trade-offs, which are evolving, to enable the system to m
aximize the privacy settings of individual players or groups. An example of this is that, in case one parti
cular entity turns out to be particularly affected by the noise of privacy, then the adaptive mechanism can
 be used to ensure that they have a lower appropriate privacy budget so that their accuracy of recommendati
ons are not impaired unintentionally. Conversely, the participants possessing a more abundant data can be c
alibrated through the mechanism of noise with a lower likelihood of increasing the privacy paranoia that wi
ll unreasonably reduce utility. (Arcolezi et al., 2025b; Cao et al., 2019; Farokhi, 2024; Gao et al., 2019;

"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} To s
uccessfully go through such challenges, adaptive privacy mechanism must be used. Unlike with the applicatio
n of the static technique where privacy budget is equally applied to everyone participating in the system,
the adaptive mechanisms are developed or modelled similarly, in that they are able to dynamically adjust pr
ivacy settings in response to real-time system feedback and learned performance deviations. Such processes
are constantly monitoring the privacy and utility trade-offs, which are evolving, to enable the system to m
aximize the privacy settings of individual players or groups. An example of this is that, in case one parti
cular entity turns out to be particularly affected by the noise of privacy, then the adaptive mechanism can
 be used to ensure that they have a lower appropriate privacy budget so that their accuracy of recommendati
ons are not impaired unintentionally. Conversely, the participants possessing a more abundant data can be c
alibrated through the mechanism of noise with a lower likelihood of increasing the privacy paranoia that wi
ll unreasonably reduce utility. (Arcolezi et al., 2025b; Cao et al., 2019; Farokhi, 2024; Gao et al., 2019;

Unlike with the application of the static technique where privacy budget is equally applied to everyone participating in the system, the adaptive mechanisms are developed or modelled similarly, in that they are able to dynamically adjust privacy settings in response to real-time system feedback and learned performance deviations. Such processes are constantly monitoring the privacy and utility trade-offs, which are evolving, to enable the system to maximize the privacy settings of individual players or groups. An example of this is that, in case one particular entity turns out to be particularly affected by the noise of privacy, then the adaptive mechanism can be used to ensure that they have a lower appropriate privacy budget so that their accuracy of recommendations are not impaired unintentionally. Conversely, the participants possessing a more abundant data can be calibrated through the mechanism of noise with a lower likelihood of increasing the privacy paranoia that will unreasonably reduce utility. "]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} To s
uccessfully go through such challenges, adaptive privacy mechanism must be used. Unlike with the applicatio
n of the static technique where privacy budget is equally applied to everyone participating in the system,
the adaptive mechanisms are developed or modelled similarly, in that they are able to dynamically adjust pr
ivacy settings in response to real-time system feedback and learned performance deviations. Such processes
are constantly monitoring the privacy and utility trade-offs, which are evolving, to enable the system to m
aximize the privacy settings of individual players or groups. An example of this is that, in case one parti
cular entity turns out to be particularly affected by the noise of privacy, then the adaptive mechanism can
 be used to ensure that they have a lower appropriate privacy budget so that their accuracy of recommendati
ons are not impaired unintentionally. Conversely, the participants possessing a more abundant data can be c
alibrated through the mechanism of noise with a lower likelihood of increasing the privacy paranoia that wi
ll unreasonably reduce utility. (Arcolezi et al., 2025b; Cao et al., 2019; Farokhi, 2024; Gao et al., 2019;

"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} To s
uccessfully go through such challenges, adaptive privacy mechanism must be used. Unlike with the applicatio
n of the static technique where privacy budget is equally applied to everyone participating in the system,
the adaptive mechanisms are developed or modelled similarly, in that they are able to dynamically adjust pr
ivacy settings in response to real-time system feedback and learned performance deviations. Such processes
are constantly monitoring the privacy and utility trade-offs, which are evolving, to enable the system to m
aximize the privacy settings of individual players or groups. An example of this is that, in case one parti
cular entity turns out to be particularly affected by the noise of privacy, then the adaptive mechanism can
 be used to ensure that they have a lower appropriate privacy budget so that their accuracy of recommendati
ons are not impaired unintentionally. Conversely, the participants possessing a more abundant data can be c
alibrated through the mechanism of noise with a lower likelihood of increasing the privacy paranoia that wi
ll unreasonably reduce utility. (Arcolezi et al., 2025b; Cao et al., 2019; Farokhi, 2024; Gao et al., 2019;

"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} To s
uccessfully go through such challenges, adaptive privacy mechanism must be used. Unlike with the applicatio
n of the static technique where privacy budget is equally applied to everyone participating in the system,
the adaptive mechanisms are developed or modelled similarly, in that they are able to dynamically adjust pr
ivacy settings in response to real-time system feedback and learned performance deviations. Such processes
are constantly monitoring the privacy and utility trade-offs, which are evolving, to enable the system to m
aximize the privacy settings of individual players or groups. An example of this is that, in case one parti
cular entity turns out to be particularly affected by the noise of privacy, then the adaptive mechanism can
 be used to ensure that they have a lower appropriate privacy budget so that their accuracy of recommendati
ons are not impaired unintentionally. Conversely, the participants possessing a more abundant data can be c
alibrated through the mechanism of noise with a lower likelihood of increasing the privacy paranoia that wi
ll unreasonably reduce utility. (Arcolezi et al., 2025b; Cao et al., 2019; Farokhi, 2024; Gao et al., 2019;

"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} To s
uccessfully go through such challenges, adaptive privacy mechanism must be used. Unlike with the applicatio
n of the static technique where privacy budget is equally applied to everyone participating in the system,
the adaptive mechanisms are developed or modelled similarly, in that they are able to dynamically adjust pr
ivacy settings in response to real-time system feedback and learned performance deviations. Such processes
are constantly monitoring the privacy and utility trade-offs, which are evolving, to enable the system to m
aximize the privacy settings of individual players or groups. An example of this is that, in case one parti
cular entity turns out to be particularly affected by the noise of privacy, then the adaptive mechanism can
be used to ensure that they have a lower appropriate privacy budget so that their accuracy of recommendati
ons are not impaired unintentionally. Conversely, the participants possessing a more abundant data can be c
alibrated through the mechanism of noise with a lower likelihood of increasing the privacy paranoia that wi
ll unreasonably reduce utility. (Arcolezi et al., 2025b; Cao et al., 2019; Farokhi, 2024; Gao et al., 2019;

"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} To s
uccessfully go through such challenges, adaptive privacy mechanism must be used. Unlike with the applicatio
n of the static technique where privacy budget is equally applied to everyone participating in the system,
the adaptive mechanisms are developed or modelled similarly, in that they are able to dynamically adjust pr
ivacy settings in response to real-time system feedback and learned performance deviations. Such processes
are constantly monitoring the privacy and utility trade-offs, which are evolving, to enable the system to m
aximize the privacy settings of individual players or groups. An example of this is that, in case one parti
cular entity turns out to be particularly affected by the noise of privacy, then the adaptive mechanism can
 be used to ensure that they have a lower appropriate privacy budget so that their accuracy of recommendati
ons are not impaired unintentionally. Conversely, the participants possessing a more abundant data can be c
alibrated through the mechanism of noise with a lower likelihood of increasing the privacy paranoia that wi
ll unreasonably reduce utility. (Arcolezi et al., 2025b; Cao et al., 2019; Farokhi, 2024; Gao et al., 2019;

Game Theory\",\"author\":[{\"family\":\"Zhou\",\"given\":\"Guorong\"}],\"issued\":{\"date-parts\":[[\"2025\
"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} To s
uccessfully go through such challenges, adaptive privacy mechanism must be used. Unlike with the applicatio
n of the static technique where privacy budget is equally applied to everyone participating in the system,
the adaptive mechanisms are developed or modelled similarly, in that they are able to dynamically adjust pr
ivacy settings in response to real-time system feedback and learned performance deviations. Such processes
are constantly monitoring the privacy and utility trade-offs, which are evolving, to enable the system to m
aximize the privacy settings of individual players or groups. An example of this is that, in case one parti
cular entity turns out to be particularly affected by the noise of privacy, then the adaptive mechanism can
 be used to ensure that they have a lower appropriate privacy budget so that their accuracy of recommendati
ons are not impaired unintentionally. Conversely, the participants possessing a more abundant data can be c
alibrated through the mechanism of noise with a lower likelihood of increasing the privacy paranoia that wi
ll unreasonably reduce utility. (Arcolezi et al., 2025b; Cao et al., 2019; Farokhi, 2024; Gao et al., 2019;

{\"date-parts\":[[\"2024\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/
csl-citation.json\"} It is shown through empirical literature that adaptive privacy approaches result in a huge loss in utility and simultaneously, they result in targeted privacy. They are able to be significantly smarter than the traditional privacy settings in the manner in which they allocate privacy resources in those areas where they are most needed, which would ensure a maintenance of a privacy at minimal compromise and trade-off of the accuracy and fairness. However, there are still difficulties that occur despite the dev

elopments. Even federated networks like FedSlate will yield disproportionate returns unless privacy budgets
 are provided to fit local demands and requirements of each of the participants. With this, adaptive privac
y budgeting must be built and communicated to activate fair results and to make the system not favour the o
nes that receive the least of users and penalize the ones that belong to the stronger dataset.(Arafat, 2025

It is shown through empirical literature that adaptive privacy approaches result in a huge loss in utility and simultaneously, they result in targeted privacy. They are able to be significantly smarter than the traditional privacy settings in the manner in which they allocate privacy resources in those areas where they are most needed, which would ensure a maintenance of a privacy at minimal compromise and trade-off of the accuracy and fairness. However, there are still difficulties that occur despite the developments. Even federated networks like FedSlate will yield disproportionate returns unless privacy budgets are provided to fit local demands and requirements of each of the participants. With this, adaptive privacy budgeting must be built and communicated to activate fair results and to make the system not favour the ones that receive the least of users and penalize the ones that belong to the stronger dataset.(Arafat, 2025b; Are et al., 2025; Badar et al., 2024a; S. {\"date-parts\":[[\"2024\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/
csl-citation.json\"} It is shown through empirical literature that adaptive privacy approaches result in a
huge loss in utility and simultaneously, they result in targeted privacy. They are able to be significantly
 smarter than the traditional privacy settings in the manner in which they allocate privacy resources in th
ose areas where they are most needed, which would ensure a maintenance of a privacy at minimal compromise a
nd trade-off of the accuracy and fairness. However, there are still difficulties that occur despite the dev
elopments. Even federated networks like FedSlate will yield disproportionate returns unless privacy budgets
 are provided to fit local demands and requirements of each of the participants. With this, adaptive privac
y budgeting must be built and communicated to activate fair results and to make the system not favour the o
nes that receive the least of users and penalize the ones that belong to the stronger dataset.(Arafat, 2025

{\"date-parts\":[[\"2024\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/
csl-citation.json\"} It is shown through empirical literature that adaptive privacy approaches result in a 
huge loss in utility and simultaneously, they result in targeted privacy. They are able to be significantly
 smarter than the traditional privacy settings in the manner in which they allocate privacy resources in th
ose areas where they are most needed, which would ensure a maintenance of a privacy at minimal compromise a
nd trade-off of the accuracy and fairness. However, there are still difficulties that occur despite the dev
elopments. Even federated networks like FedSlate will yield disproportionate returns unless privacy budgets
 are provided to fit local demands and requirements of each of the participants. With this, adaptive privac
y budgeting must be built and communicated to activate fair results and to make the system not favour the o
nes that receive the least of users and penalize the ones that belong to the stronger dataset.(Arafat, 2025

csl-citation.json\"} It is shown through empirical literature that adaptive privacy approaches result in a
huge loss in utility and simultaneously, they result in targeted privacy. They are able to be significantly
smarter than the traditional privacy settings in the manner in which they allocate privacy resources in th
ose areas where they are most needed, which would ensure a maintenance of a privacy at minimal compromise a
nd trade-off of the accuracy and fairness. However, there are still difficulties that occur despite the dev
elopments. Even federated networks like FedSlate will yield disproportionate returns unless privacy budgets
are provided to fit local demands and requirements of each of the participants. With this, adaptive privac
y budgeting must be built and communicated to activate fair results and to make the system not favour the o
nes that receive the least of users and penalize the ones that belong to the stronger dataset.(Arafat, 2025

They are able to be significantly smarter than the traditional privacy settings in the manner in which they allocate privacy resources in those areas where they are most needed, which would ensure a maintenance of a privacy at minimal compromise and trade-off of the accuracy and fairness. However, there are still difficulties that occur despite the developments. Even federated networks like FedSlate will yield disproportionate returns unless privacy budgets are provided to fit local demands and requirements of each of the participants. With this, adaptive privacy budgeting must be built and communicated to activate fair results and to make the system not favour the ones that receive the least of users and penalize the ones that belong to the stronger dataset.(Arafat, 2025b; Are et al., 2025; Badar et al., 2024a; S. {\"date-parts\":[[\"2024\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/
csl-citation.json\"} It is shown through empirical literature that adaptive privacy approaches result in a

huge loss in utility and simultaneously, they result in targeted privacy. They are able to be significantly smarter than the traditional privacy settings in the manner in which they allocate privacy resources in those areas where they are most needed, which would ensure a maintenance of a privacy at minimal compromise and trade-off of the accuracy and fairness. However, there are still difficulties that occur despite the developments. Even federated networks like FedSlate will yield disproportionate returns unless privacy budgets are provided to fit local demands and requirements of each of the participants. With this, adaptive privacy budgeting must be built and communicated to activate fair results and to make the system not favour the ones that receive the least of users and penalize the ones that belong to the stronger dataset.(Arafat, 2025b; Are et al., 2025; Badar et al., 2024a; S. {\"date-parts\":[[\"2024\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/
csl-citation.json\"} It is shown through empirical literature that adaptive privacy approaches result in a
huge loss in utility and simultaneously, they result in targeted privacy. They are able to be significantly
 smarter than the traditional privacy settings in the manner in which they allocate privacy resources in th
ose areas where they are most needed, which would ensure a maintenance of a privacy at minimal compromise a
nd trade-off of the accuracy and fairness. However, there are still difficulties that occur despite the dev
elopments. Even federated networks like FedSlate will yield disproportionate returns unless privacy budgets
 are provided to fit local demands and requirements of each of the participants. With this, adaptive privac
y budgeting must be built and communicated to activate fair results and to make the system not favour the o
nes that receive the least of users and penalize the ones that belong to the stronger dataset.(Arafat, 2025

csl-citation.json\"} It is shown through empirical literature that adaptive privacy approaches result in a
huge loss in utility and simultaneously, they result in targeted privacy. They are able to be significantly
smarter than the traditional privacy settings in the manner in which they allocate privacy resources in th
ose areas where they are most needed, which would ensure a maintenance of a privacy at minimal compromise a
nd trade-off of the accuracy and fairness. However, there are still difficulties that occur despite the dev
elopments. Even federated networks like FedSlate will yield disproportionate returns unless privacy budgets
are provided to fit local demands and requirements of each of the participants. With this, adaptive privac
y budgeting must be built and communicated to activate fair results and to make the system not favour the o
nes that receive the least of users and penalize the ones that belong to the stronger dataset.(Arafat, 2025

 Calibrated Fast Fair Federated Recommendation System\",\"author\":[{\"family\":\"Zhu\",\"given\":\"Zhitao\
"},{\"family\":\"Si\",\"given\":\"Shijing\"},{\"family\":\"Wang\",\"given\":\"Jianzong\"},{\"family\":\"Xia
o\",\"given\":\"Jing\"}],\"issued\":{\"date-parts\":[[\"2022\"]]}}}],\"schema\":\"https://github.com/citati
on-style-language/schema/raw/master/csl-citation.json\"} A research direction that is aimed at improving dy
namic privacy systems, which maximize the trade-off which exists between privacy, utility, and fairness sho
uld be one of the research directions in the future. It is noteworthy especially in heterogeneous user popu
lation and complex data environment where a one-size-fits-all approach is most likely to fail. In addition,
 in federated learning systems where the interaction information between the users is sparse it is dire to
apply data augmentation, as well as skilled spreading of information across richer datasets in federated le
arning. Such strategies will have the capability of enhancing both strength and effectiveness of models of
recommendations which will be capable of operating in a dependable manner even during data paucity. Last bu
t not the least, federated recommendation system development requires the ability to balance between the ma
intenance of privacy and high utility and equity such that every one of the users experiences safe, efficie
nt and personalised recommendation in their everyday lives online. (Agrawal et al., 2024; Boratto, 2020; H.

 Calibrated Fast Fair Federated Recommendation System\",\"author\":[{\"family\":\"Zhu\",\"given\":\"Zhitao\
"},{\"family\":\"Si\",\"given\":\"Shijing\"},{\"family\":\"Wang\",\"given\":\"Jianzong\"},{\"family\":\"Xia
o\",\"given\":\"Jing\"}],\"issued\":{\"date-parts\":[[\"2022\"]]}}}],\"schema\":\"https://github.com/citati
on-style-language/schema/raw/master/csl-citation.json\"} A research direction that is aimed at improving dy
namic privacy systems, which maximize the trade-off which exists between privacy, utility, and fairness sho
uld be one of the research directions in the future. It is noteworthy especially in heterogeneous user popu
lation and complex data environment where a one-size-fits-all approach is most likely to fail. In addition,
 in federated learning systems where the interaction information between the users is sparse it is dire to
apply data augmentation, as well as skilled spreading of information across richer datasets in federated le
arning. Such strategies will have the capability of enhancing both strength and effectiveness of models of
recommendations which will be capable of operating in a dependable manner even during data paucity. Last bu
t not the least, federated recommendation system development requires the ability to balance between the ma
intenance of privacy and high utility and equity such that every one of the users experiences safe, efficie
nt and personalised recommendation in their everyday lives online. (Agrawal et al., 2024; Boratto, 2020; H.

 Calibrated Fast Fair Federated Recommendation System\",\"author\":[{\"family\":\"Zhu\",\"given\":\"Zhitao\
"},{\"family\":\"Si\",\"given\":\"Shijing\"},{\"family\":\"Wang\",\"given\":\"Jianzong\"},{\"family\":\"Xia
o\",\"given\":\"Jing\"}],\"issued\":{\"date-parts\":[[\"2022\"]]}}}],\"schema\":\"https://github.com/citati
on-style-language/schema/raw/master/csl-citation.json\"} A research direction that is aimed at improving dy
namic privacy systems, which maximize the trade-off which exists between privacy, utility, and fairness sho
uld be one of the research directions in the future. It is noteworthy especially in heterogeneous user popu
lation and complex data environment where a one-size-fits-all approach is most likely to fail. In addition,
 in federated learning systems where the interaction information between the users is sparse it is dire to
apply data augmentation, as well as skilled spreading of information across richer datasets in federated le
arning. Such strategies will have the capability of enhancing both strength and effectiveness of models of
recommendations which will be capable of operating in a dependable manner even during data paucity. Last bu
t not the least, federated recommendation system development requires the ability to balance between the ma
intenance of privacy and high utility and equity such that every one of the users experiences safe, efficie
nt and personalised recommendation in their everyday lives online. (Agrawal et al., 2024; Boratto, 2020; H.

on-style-language/schema/raw/master/csl-citation.json\"} A research direction that is aimed at improving dy
namic privacy systems, which maximize the trade-off which exists between privacy, utility, and fairness sho
uld be one of the research directions in the future. It is noteworthy especially in heterogeneous user popu
lation and complex data environment where a one-size-fits-all approach is most likely to fail. In addition,
 in federated learning systems where the interaction information between the users is sparse it is dire to
apply data augmentation, as well as skilled spreading of information across richer datasets in federated le
arning. Such strategies will have the capability of enhancing both strength and effectiveness of models of
recommendations which will be capable of operating in a dependable manner even during data paucity. Last bu
t not the least, federated recommendation system development requires the ability to balance between the ma

intenance of privacy and high utility and equity such that every one of the users experiences safe, efficie
nt and personalised recommendation in their everyday lives online. (Agrawal et al., 2024; Boratto, 2020; H.

It is noteworthy especially in heterogeneous user population and complex data environment where a one-size-fits-all approach is most likely to fail. In addition, in federated learning systems where the interaction information between the users is sparse it is dire to apply data augmentation, as well as skilled spreading of information across richer datasets in federated learning. Such strategies will have the capability of enhancing both strength and effectiveness of models of recommendations which will be capable of operating in a dependable manner even during data paucity. Last but not the least, federated recommendation system development requires the ability to balance between the maintenance of privacy and high utility and equity such that every one of the users experiences safe, efficient and personalised recommendation in their everyday lives online. It is noteworthy especially in heterogeneous user population and complex data environment where a one-size-fits-all approach is most likely to fail. In addition, in federated learning systems where the interaction information between the users is sparse it is dire to apply data augmentation, as well as skilled spreading of information across richer datasets in federated learning. Such strategies will have the capability of enhancing both strength and effectiveness of models of recommendations which will be capable of operating in a dependable manner even during data paucity. Last but not the least, federated recommendation system development requires the ability to balance between the maintenance of privacy and high utility and equity such that every one of the users experiences safe, efficient and personalised recommendation in their everyday lives online. on-style-language/schema/raw/master/csl-citation.json\"} A research direction that is aimed at improving dy
namic privacy systems, which maximize the trade-off which exists between privacy, utility, and fairness sho
uld be one of the research directions in the future. It is noteworthy especially in heterogeneous user popu
lation and complex data environment where a one-size-fits-all approach is most likely to fail. In addition,
 in federated learning systems where the interaction information between the users is sparse it is dire to
apply data augmentation, as well as skilled spreading of information across richer datasets in federated le
arning. Such strategies will have the capability of enhancing both strength and effectiveness of models of
recommendations which will be capable of operating in a dependable manner even during data paucity. Last bu
t not the least, federated recommendation system development requires the ability to balance between the ma
intenance of privacy and high utility and equity such that every one of the users experiences safe, efficie
nt and personalised recommendation in their everyday lives online. (Agrawal et al., 2024; Boratto, 2020; H.

It is noteworthy especially in heterogeneous user population and complex data environment where a one-size-fits-all approach is most likely to fail. In addition, in federated learning systems where the interaction information between the users is sparse it is dire to apply data augmentation, as well as skilled spreading of information across richer datasets in federated learning. Such strategies will have the capability of enhancing both strength and effectiveness of models of recommendations which will be capable of operating in a dependable manner even during data paucity. Last but not the least, federated recommendation system development requires the ability to balance between the maintenance of privacy and high utility and equity such that every one of the users experiences safe, efficient and personalised recommendation in their everyday lives online.  Calibrated Fast Fair Federated Recommendation System\",\"author\":[{\"family\":\"Zhu\",\"given\":\"Zhitao\
"},{\"family\":\"Si\",\"given\":\"Shijing\"},{\"family\":\"Wang\",\"given\":\"Jianzong\"},{\"family\":\"Xia
o\",\"given\":\"Jing\"}],\"issued\":{\"date-parts\":[[\"2022\"]]}}}],\"schema\":\"https://github.com/citati
on-style-language/schema/raw/master/csl-citation.json\"} A research direction that is aimed at improving dy
namic privacy systems, which maximize the trade-off which exists between privacy, utility, and fairness sho
uld be one of the research directions in the future. It is noteworthy especially in heterogeneous user popu
lation and complex data environment where a one-size-fits-all approach is most likely to fail. In addition,
 in federated learning systems where the interaction information between the users is sparse it is dire to
apply data augmentation, as well as skilled spreading of information across richer datasets in federated le
arning. Such strategies will have the capability of enhancing both strength and effectiveness of models of
recommendations which will be capable of operating in a dependable manner even during data paucity. Last bu
t not the least, federated recommendation system development requires the ability to balance between the ma
intenance of privacy and high utility and equity such that every one of the users experiences safe, efficie
nt and personalised recommendation in their everyday lives online. (Agrawal et al., 2024; Boratto, 2020; H.

 Calibrated Fast Fair Federated Recommendation System\",\"author\":[{\"family\":\"Zhu\",\"given\":\"Zhitao\
"},{\"family\":\"Si\",\"given\":\"Shijing\"},{\"family\":\"Wang\",\"given\":\"Jianzong\"},{\"family\":\"Xia
o\",\"given\":\"Jing\"}],\"issued\":{\"date-parts\":[[\"2022\"]]}}}],\"schema\":\"https://github.com/citati
on-style-language/schema/raw/master/csl-citation.json\"} A research direction that is aimed at improving dy
namic privacy systems, which maximize the trade-off which exists between privacy, utility, and fairness sho
uld be one of the research directions in the future. It is noteworthy especially in heterogeneous user popu
lation and complex data environment where a one-size-fits-all approach is most likely to fail. In addition,
 in federated learning systems where the interaction information between the users is sparse it is dire to
apply data augmentation, as well as skilled spreading of information across richer datasets in federated le
arning. Such strategies will have the capability of enhancing both strength and effectiveness of models of
recommendations which will be capable of operating in a dependable manner even during data paucity. Last bu
t not the least, federated recommendation system development requires the ability to balance between the ma
intenance of privacy and high utility and equity such that every one of the users experiences safe, efficie
nt and personalised recommendation in their everyday lives online. (Agrawal et al., 2024; Boratto, 2020; H.

It is noteworthy especially in heterogeneous user population and complex data environment where a one-size-fits-all approach is most likely to fail. In addition, in federated learning systems where the interaction information between the users is sparse it is dire to apply data augmentation, as well as skilled spreading of information across richer datasets in federated learning. Such strategies will have the capability of enhancing both strength and effectiveness of models of recommendations which will be capable of operating in a dependable manner even during data paucity. Last bu

t not the least, federated recommendation system development requires the ability to balance between the maintenance of privacy and high utility and equity such that every one of the users experiences safe, efficient and personalised recommendation in their everyday lives online. It is noteworthy especially in heterogeneous user population and complex data environment where a one-size-fits-all approach is most likely to fail. In addition, in federated learning systems where the interaction information between the users is sparse it is dire to apply data augmentation, as well as skilled spreading of information across richer datasets in federated learning. Such strategies will have the capability of enhancing both strength and effectiveness of models of recommendations which will be capable of operating in a dependable manner even during data paucity. Last but not the least, federated recommendation system development requires the ability to balance between the maintenance of privacy and high utility and equity such that every one of the users experiences safe, efficient and personalised recommendation in their everyday lives online. It is noteworthy especially in heterogeneous user population and complex data environment where a one-size-fits-all approach is most likely to fail. In addition, in federated learning systems where the interaction information between the users is sparse it is dire to apply data augmentation, as well as skilled spreading of information across richer datasets in federated learning. Such strategies will have the capability of enhancing both strength and effectiveness of models of recommendations which will be capable of operating in a dependable manner even during data paucity. Last but not the least, federated recommendation system development requires the ability to balance between the maintenance of privacy and high utility and equity such that every one of the users experiences safe, efficient and personalised recommendation in their everyday lives online. on-style-language/schema/raw/master/csl-citation.json\"} A research direction that is aimed at improving dynamic privacy systems, which maximize the trade-off which exists between privacy, utility, and fairness should be one of the research directions in the future. It is noteworthy especially in heterogeneous user population and complex data environment where a one-size-fits-all approach is most likely to fail. In addition, in federated learning systems where the interaction information between the users is sparse it is dire to apply data augmentation, as well as skilled spreading of information across richer datasets in federated learning. Such strategies will have the capability of enhancing both strength and effectiveness of models of recommendations which will be capable of operating in a dependable manner even during data paucity. Last but not the least, federated recommendation system development requires the ability to balance between the maintenance of privacy and high utility and equity such that every one of the users experiences safe, efficient and personalised recommendation in their everyday lives online.  Calibrated Fast Fair Federated Recommendation System\",\"author\":[{\"family\":\"Zhu\",\"given\":\"Zhitao\
"},{\"family\":\"Si\",\"given\":\"Shijing\"},{\"family\":\"Wang\",\"given\":\"Jianzong\"},{\"family\":\"Xia
o\",\"given\":\"Jing\"}],\"issued\":{\"date-parts\":[[\"2022\"]]}}}],\"schema\":\"https://github.com/citati
on-style-language/schema/raw/master/csl-citation.json\"} A research direction that is aimed at improving dy
namic privacy systems, which maximize the trade-off which exists between privacy, utility, and fairness sho
uld be one of the research directions in the future. It is noteworthy especially in heterogeneous user popu
lation and complex data environment where a one-size-fits-all approach is most likely to fail. In addition,
 in federated learning systems where the interaction information between the users is sparse it is dire to
apply data augmentation, as well as skilled spreading of information across richer datasets in federated le
arning. Such strategies will have the capability of enhancing both strength and effectiveness of models of
recommendations which will be capable of operating in a dependable manner even during data paucity. Last bu
t not the least, federated recommendation system development requires the ability to balance between the ma
intenance of privacy and high utility and equity such that every one of the users experiences safe, efficie
nt and personalised recommendation in their everyday lives online. (Agrawal et al., 2024; Boratto, 2020; H.

 Calibrated Fast Fair Federated Recommendation System\",\"author\":[{\"family\":\"Zhu\",\"given\":\"Zhitao\
"},{\"family\":\"Si\",\"given\":\"Shijing\"},{\"family\":\"Wang\",\"given\":\"Jianzong\"},{\"family\":\"Xia
o\",\"given\":\"Jing\"}],\"issued\":{\"date-parts\":[[\"2022\"]]}}}],\"schema\":\"https://github.com/citati
on-style-language/schema/raw/master/csl-citation.json\"} A research direction that is aimed at improving dy
namic privacy systems, which maximize the trade-off which exists between privacy, utility, and fairness sho
uld be one of the research directions in the future. It is noteworthy especially in heterogeneous user popu
lation and complex data environment where a one-size-fits-all approach is most likely to fail. In addition,
 in federated learning systems where the interaction information between the users is sparse it is dire to
apply data augmentation, as well as skilled spreading of information across richer datasets in federated le
arning. Such strategies will have the capability of enhancing both strength and effectiveness of models of
recommendations which will be capable of operating in a dependable manner even during data paucity. Last bu
t not the least, federated recommendation system development requires the ability to balance between the ma
intenance of privacy and high utility and equity such that every one of the users experiences safe, efficie
nt and personalised recommendation in their everyday lives online. (Agrawal et al., 2024; Boratto, 2020; H.

 Calibrated Fast Fair Federated Recommendation System\",\"author\":[{\"family\":\"Zhu\",\"given\":\"Zhitao\
"},{\"family\":\"Si\",\"given\":\"Shijing\"},{\"family\":\"Wang\",\"given\":\"Jianzong\"},{\"family\":\"Xia
o\",\"given\":\"Jing\"}],\"issued\":{\"date-parts\":[[\"2022\"]]}}}],\"schema\":\"https://github.com/citati

on-style-language/schema/raw/master/csl-citation.json\"} A research direction that is aimed at improving dy
namic privacy systems, which maximize the trade-off which exists between privacy, utility, and fairness sho
uld be one of the research directions in the future. It is noteworthy especially in heterogeneous user popu
lation and complex data environment where a one-size-fits-all approach is most likely to fail. In addition,
 in federated learning systems where the interaction information between the users is sparse it is dire to
apply data augmentation, as well as skilled spreading of information across richer datasets in federated le
arning. Such strategies will have the capability of enhancing both strength and effectiveness of models of
recommendations which will be capable of operating in a dependable manner even during data paucity. Last bu
t not the least, federated recommendation system development requires the ability to balance between the ma
intenance of privacy and high utility and equity such that every one of the users experiences safe, efficie
nt and personalised recommendation in their everyday lives online. (Agrawal et al., 2024; Boratto, 2020; H.

 Calibrated Fast Fair Federated Recommendation System\",\"author\":[{\"family\":\"Zhu\",\"given\":\"Zhitao\
"},{\"family\":\"Si\",\"given\":\"Shijing\"},{\"family\":\"Wang\",\"given\":\"Jianzong\"},{\"family\":\"Xia
o\",\"given\":\"Jing\"}],\"issued\":{\"date-parts\":[[\"2022\"]]}}}],\"schema\":\"https://github.com/citati
on-style-language/schema/raw/master/csl-citation.json\"} A research direction that is aimed at improving dy
namic privacy systems, which maximize the trade-off which exists between privacy, utility, and fairness sho
uld be one of the research directions in the future. It is noteworthy especially in heterogeneous user popu
lation and complex data environment where a one-size-fits-all approach is most likely to fail. In addition,
 in federated learning systems where the interaction information between the users is sparse it is dire to
apply data augmentation, as well as skilled spreading of information across richer datasets in federated le
arning. Such strategies will have the capability of enhancing both strength and effectiveness of models of
recommendations which will be capable of operating in a dependable manner even during data paucity. Last bu
t not the least, federated recommendation system development requires the ability to balance between the ma
intenance of privacy and high utility and equity such that every one of the users experiences safe, efficie
nt and personalised recommendation in their everyday lives online. (Agrawal et al., 2024; Boratto, 2020; H.

It reviews as well a number of strategies of how to solve the challenges of data heterogeneity, communication efficiency and equity in federated recommender systems and how the rating bias is effectively handled by the models. The latest innovations in federated learning as a recommendation system, such as FedRec and FCF, have primarily focused on matrix-factorization-based collaborative filtering, and FedMF also has a homomorphic encryption transmission of the gradients. Regardless of such developments, the majority of the existing literature is inclined to disapprove of the multifacetedness of the challenges of fairness, prejudice, and the threat to the integrity of the systems that play a fundamental role in generating effective and robust recommender systems. Even though some of the literature attempts to enhance effectiveness of federated recommender system by suggesting mechanisms through which convergence can be expedited or lightweight communication based on lightweight communication is offered, a holistic understanding of veracity and faithfulness of federated recommender system with various model of attacks is yet to be accomplished as a research. Moreover, one of the opportunities of higher performance and privacy facilitated by the adoption of foundation models in federated recommendation systems is the fact that the technology is still in its infancy. More specifically, they apply their massive pre-training knowledge in the models to improve the quality of the recommendations and federated learning is used to make the sensitive user interaction data fed to fine-tune the models local. However, to fully incorporate the opportunities suggested by the foundation models in federated recommendation systems, a novel area of research is required to explore the phenomenon of how their pre-training, and capabilities can be used to mitigate the problem of heterogeneity in data and improve the effectiveness of model aggregation. Paradigm shift in this federated environment suggested in the recent literature using large language model will entail simplicity of data integration and complete utilization of large language model to attain better results, but, at the expense of augmented communication due to large parameter sizes. hub.com/citation-style-language/schema/raw/master/csl-citation.json\"} The section under consideration eval
uates the literature content related to federated learning in reference to recommendation systems with part
icular focus on privacy-preserving tools and their impact on the model results. It reviews as well a number
 of strategies of how to solve the challenges of data heterogeneity, communication efficiency and equity in
 federated recommender systems and how the rating bias is effectively handled by the models. The latest inn
ovations in federated learning as a recommendation system, such as FedRec and FCF, have primarily focused o
n matrix-factorization-based collaborative filtering, and FedMF also has a homomorphic encryption transmiss
ion of the gradients. Regardless of such developments, the majority of the existing literature is inclined
to disapprove of the multifacetedness of the challenges of fairness, prejudice, and the threat to the integ
rity of the systems that play a fundamental role in generating effective and robust recommender systems. Ev
en though some of the literature attempts to enhance effectiveness of federated recommender system by sugge
sting mechanisms through which convergence can be expedited or lightweight communication based on lightweig
ht communication is offered, a holistic understanding of veracity and faithfulness of federated recommender
 system with various model of attacks is yet to be accomplished as a research. Moreover, one of the opportu
nities of higher performance and privacy facilitated by the adoption of foundation models in federated reco
mmendation systems is the fact that the technology is still in its infancy. More specifically, they apply t
heir massive pre-training knowledge in the models to improve the quality of the recommendations and federat
ed learning is used to make the sensitive user interaction data fed to fine-tune the models local. However,
 to fully incorporate the opportunities suggested by the foundation models in federated recommendation syst
ems, a novel area of research is required to explore the phenomenon of how their pre-training, and capabili
ties can be used to mitigate the problem of heterogeneity in data and improve the effectiveness of model ag
gregation. Paradigm shift in this federated environment suggested in the recent literature using large lang
uage model will entail simplicity of data integration and complete utilization of large language model to a
ttain better results, but, at the expense of augmented communication due to large parameter sizes. (Béguier

hub.com/citation-style-language/schema/raw/master/csl-citation.json\"} The section under consideration eval
uates the literature content related to federated learning in reference to recommendation systems with part

```
icular focus on privacy-preserving tools and their impact on the model results. It reviews as well a number
 of strategies of how to solve the challenges of data heterogeneity, communication efficiency and equity in
 federated recommender systems and how the rating bias is effectively handled by the models. The latest inn
ovations in federated learning as a recommendation system, such as FedRec and FCF, have primarily focused o
n matrix-factorization-based collaborative filtering, and FedMF also has a homomorphic encryption transmiss
ion of the gradients. Regardless of such developments, the majority of the existing literature is inclined
to disapprove of the multifacetedness of the challenges of fairness, prejudice, and the threat to the integ
rity of the systems that play a fundamental role in generating effective and robust recommender systems. Ev
en though some of the literature attempts to enhance effectiveness of federated recommender system by sugge
sting mechanisms through which convergence can be expedited or lightweight communication based on lightweig
ht communication is offered, a holistic understanding of veracity and faithfulness of federated recommender
 system with various model of attacks is yet to be accomplished as a research. Moreover, one of the opportu
nities of higher performance and privacy facilitated by the adoption of foundation models in federated reco
mmendation systems is the fact that the technology is still in its infancy. More specifically, they apply t
heir massive pre-training knowledge in the models to improve the quality of the recommendations and federat
ed learning is used to make the sensitive user interaction data fed to fine-tune the models local. However,
 to fully incorporate the opportunities suggested by the foundation models in federated recommendation syst
ems, a novel area of research is required to explore the phenomenon of how their pre-training, and capabili
ties can be used to mitigate the problem of heterogeneity in data and improve the effectiveness of model ag
gregation. Paradigm shift in this federated environment suggested in the recent literature using large lang
uage model will entail simplicity of data integration and complete utilization of large language model to a
ttain better results, but, at the expense of augmented communication due to large parameter sizes. (Béguier

family\":\"Xiao\",\"given\":\"Jing\"}],\"issued\":{\"date-parts\":[[\"2022\"]]}}}],\"schema\":\"https://git
hub.com/citation-style-language/schema/raw/master/csl-citation.json\"} The section under consideration evaluates the literature content related to federated learning in reference to recommendation systems with particular focus on privacy-preserving tools and their impact on the model results. It reviews as well a number of strategies of how to solve the challenges of data heterogeneity, communication efficiency and equity in federated recommender systems and how the rating bias is effectively handled by the models. The latest innovations in federated learning as a recommendation system, such as FedRec and FCF, have primarily focused on matrix-factorization-based collaborative filtering, and FedMF also has a homomorphic encryption transmiss

ion of the gradients. Regardless of such developments, the majority of the existing literature is inclined
to disapprove of the multifacetedness of the challenges of fairness, prejudice, and the threat to the integ
rity of the systems that play a fundamental role in generating effective and robust recommender systems. Ev
en though some of the literature attempts to enhance effectiveness of federated recommender system by sugge
sting mechanisms through which convergence can be expedited or lightweight communication based on lightweig
ht communication is offered, a holistic understanding of veracity and faithfulness of federated recommender
 system with various model of attacks is yet to be accomplished as a research. Moreover, one of the opportu
nities of higher performance and privacy facilitated by the adoption of foundation models in federated reco
mmendation systems is the fact that the technology is still in its infancy. More specifically, they apply t
heir massive pre-training knowledge in the models to improve the quality of the recommendations and federat
ed learning is used to make the sensitive user interaction data fed to fine-tune the models local. However,
 to fully incorporate the opportunities suggested by the foundation models in federated recommendation syst
ems, a novel area of research is required to explore the phenomenon of how their pre-training, and capabili
ties can be used to mitigate the problem of heterogeneity in data and improve the effectiveness of model ag
gregation. Paradigm shift in this federated environment suggested in the recent literature using large lang
uage model will entail simplicity of data integration and complete utilization of large language model to a
ttain better results, but, at the expense of augmented communication due to large parameter sizes. (Béguier

It reviews as well a number of strategies of how to solve the challenges of data heterogeneity, communication efficiency and equity in federated recommender systems and how the rating bias is effectively handled by the models. The latest innovations in federated learning as a recommendation system, such as FedRec and FCF, have primarily focused on matrix-factorization-based collaborative filtering, and FedMF also has a homomorphic encryption transmission of the gradients. Regardless of such developments, the majority of the existing literature is inclined to disapprove of the multifacetedness of the challenges of fairness, prejudice, and the threat to the integrity of the systems that play a fundamental role in generating effective and robust recommender systems. Even though some of the literature attempts to enhance effectiveness of federated recommender system by suggesting mechanisms through which convergence can be expedited or lightweight communication based on lightweight communication is offered, a holistic understanding of veracity and faithfulness of federated recommender system with various model of attacks is yet to be accomplished as a research. Moreover, one of the opportunities of higher performance and privacy facilitated by the adoption of foundation models in federated recommendation systems is the fact that the technology is still in its infancy. More specifically, they apply t

```
heir massive pre-training knowledge in the models to improve the quality of the recommendations and federat
ed learning is used to make the sensitive user interaction data fed to fine-tune the models local. However,
 to fully incorporate the opportunities suggested by the foundation models in federated recommendation syst
ems, a novel area of research is required to explore the phenomenon of how their pre-training, and capabili
ties can be used to mitigate the problem of heterogeneity in data and improve the effectiveness of model ag
gregation. Paradigm shift in this federated environment suggested in the recent literature using large lang
uage model will entail simplicity of data integration and complete utilization of large language model to a
ttain better results, but, at the expense of augmented communication due to large parameter sizes. (Béguier

It reviews as well a number of strategies of how to solve the challenges of data heterogeneity, communication efficiency and equity in federated recommender systems and how the rating bias is effectively handled by the models. The latest innovations in federated learning as a recommendation system, such as FedRec and FCF, have primarily focused on matrix-factorization-based collaborative filtering, and FedMF also has a homomorphic encryption transmission of the gradients. Regardless of such developments, the majority of the existing literature is inclined to disapprove of the multifacetedness of the challenges of fairness, prejudice, and the threat to the integrity of the systems that play a fundamental role in generating effective and robust recommender systems. Even though some of the literature attempts to enhance effectiveness of federated recommender system by suggesting mechanisms through which convergence can be expedited or lightweight communication based on lightweight communication is offered, a holistic understanding of veracity and faithfulness of federated recommender system with various model of attacks is yet to be accomplished as a research. Moreover, one of the opportunities of higher performance and privacy facilitated by the adoption of foundation models in federated recommendation systems is the fact that the technology is still in its infancy. More specifically, they apply their massive pre-training knowledge in the models to improve the quality of the recommendations and federated learning is used to make the sensitive user interaction data fed to fine-tune the models local. However, to fully incorporate the opportunities suggested by the foundation models in federated recommendation syst

ems, a novel area of research is required to explore the phenomenon of how their pre-training, and capabili
ties can be used to mitigate the problem of heterogeneity in data and improve the effectiveness of model ag
gregation. Paradigm shift in this federated environment suggested in the recent literature using large lang
uage model will entail simplicity of data integration and complete utilization of large language model to a
ttain better results, but, at the expense of augmented communication due to large parameter sizes. (Béguier

en\":\"Zhitao\"},{\"family\":\"Si\",\"given\":\"Shijing\"},{\"family\":\"Wang\",\"given\":\"Jianzong\"},{\"
family\":\"Xiao\",\"given\":\"Jing\"}],\"issued\":{\"date-parts\":[[\"2022\"]]}}}],\"schema\":\"https://git
hub.com/citation-style-language/schema/raw/master/csl-citation.json\"} The section under consideration evaluates the literature content related to federated learning in reference to recommendation systems with particular focus on privacy-preserving tools and their impact on the model results. It reviews as well a number of strategies of how to solve the challenges of data heterogeneity, communication efficiency and equity in federated recommender systems and how the rating bias is effectively handled by the models. The latest innovations in federated learning as a recommendation system, such as FedRec and FCF, have primarily focused on matrix-factorization-based collaborative filtering, and FedMF also has a homomorphic encryption transmission of the gradients. Regardless of such developments, the majority of the existing literature is inclined to disapprove of the multifacetedness of the challenges of fairness, prejudice, and the threat to the integrity of the systems that play a fundamental role in generating effective and robust recommender systems. Even though some of the literature attempts to enhance effectiveness of federated recommender system by suggesting mechanisms through which convergence can be expedited or lightweight communication based on lightweight communication is offered, a holistic understanding of veracity and faithfulness of federated recommender system with various model of attacks is yet to be accomplished as a research. Moreover, one of the opportunities of higher performance and privacy facilitated by the adoption of foundation models in federated recommendation systems is the fact that the technology is still in its infancy. More specifically, they apply their massive pre-training knowledge in the models to improve the quality of the recommendations and federated learning is used to make the sensitive user interaction data fed to fine-tune the models local. However, to fully incorporate the opportunities suggested by the foundation models in federated recommendation systems, a novel area of research is required to explore the phenomenon of how their pre-training, and capabilities can be used to mitigate the problem of heterogeneity in data and improve the effectiveness of model aggregation. Paradigm shift in this federated environment suggested in the recent literature using large language model will entail simplicity of data integration and complete utilization of large language model to attain better results, but, at the expense of augmented communication due to large parameter sizes. family\":\"Xiao\",\"given\":\"Jing\"}],\"issued\":{\"date-parts\":[[\"2022\"]]}}}],\"schema\":\"https://git
hub.com/citation-style-language/schema/raw/master/csl-citation.json\"} The section under consideration eval
uates the literature content related to federated learning in reference to recommendation systems with part
icular focus on privacy-preserving tools and their impact on the model results. It reviews as well a number
 of strategies of how to solve the challenges of data heterogeneity, communication efficiency and equity in
 federated recommender systems and how the rating bias is effectively handled by the models. The latest inn
ovations in federated learning as a recommendation system, such as FedRec and FCF, have primarily focused o
n matrix-factorization-based collaborative filtering, and FedMF also has a homomorphic encryption transmiss
ion of the gradients. Regardless of such developments, the majority of the existing literature is inclined
to disapprove of the multifacetedness of the challenges of fairness, prejudice, and the threat to the integ
rity of the systems that play a fundamental role in generating effective and robust recommender systems. Ev
en though some of the literature attempts to enhance effectiveness of federated recommender system by sugge
sting mechanisms through which convergence can be expedited or lightweight communication based on lightweig
ht communication is offered, a holistic understanding of veracity and faithfulness of federated recommender
 system with various model of attacks is yet to be accomplished as a research. Moreover, one of the opportu
nities of higher performance and privacy facilitated by the adoption of foundation models in federated reco
mmendation systems is the fact that the technology is still in its infancy. More specifically, they apply t
heir massive pre-training knowledge in the models to improve the quality of the recommendations and federat
ed learning is used to make the sensitive user interaction data fed to fine-tune the models local. However,
 to fully incorporate the opportunities suggested by the foundation models in federated recommendation syst
ems, a novel area of research is required to explore the phenomenon of how their pre-training, and capabili
ties can be used to mitigate the problem of heterogeneity in data and improve the effectiveness of model ag
gregation. Paradigm shift in this federated environment suggested in the recent literature using large lang
uage model will entail simplicity of data integration and complete utilization of large language model to a
ttain better results, but, at the expense of augmented communication due to large parameter sizes. (Béguier

en\":\"Zhitao\"},{\"family\":\"Si\",\"given\":\"Shijing\"},{\"family\":\"Wang\",\"given\":\"Jianzong\"},{\"
family\":\"Xiao\",\"given\":\"Jing\"}],\"issued\":{\"date-parts\":[[\"2022\"]]}}}],\"schema\":\"https://git
hub.com/citation-style-language/schema/raw/master/csl-citation.json\"} The section under consideration eval
uates the literature content related to federated learning in reference to recommendation systems with part
icular focus on privacy-preserving tools and their impact on the model results. It reviews as well a number
 of strategies of how to solve the challenges of data heterogeneity, communication efficiency and equity in
 federated recommender systems and how the rating bias is effectively handled by the models. The latest inn
ovations in federated learning as a recommendation system, such as FedRec and FCF, have primarily focused o
n matrix-factorization-based collaborative filtering, and FedMF also has a homomorphic encryption transmiss
ion of the gradients. Regardless of such developments, the majority of the existing literature is inclined
 to disapprove of the multifacetedness of the challenges of fairness, prejudice, and the threat to the integ
rity of the systems that play a fundamental role in generating effective and robust recommender systems. Ev
en though some of the literature attempts to enhance effectiveness of federated recommender system by sugge
sting mechanisms through which convergence can be expedited or lightweight communication based on lightweig
ht communication is offered, a holistic understanding of veracity and faithfulness of federated recommender
 system with various model of attacks is yet to be accomplished as a research. Moreover, one of the opportu
nities of higher performance and privacy facilitated by the adoption of foundation models in federated reco
mmendation systems is the fact that the technology is still in its infancy. More specifically, they apply t
heir massive pre-training knowledge in the models to improve the quality of the recommendations and federat
ed learning is used to make the sensitive user interaction data fed to fine-tune the models local. However,
 to fully incorporate the opportunities suggested by the foundation models in federated recommendation syst
ems, a novel area of research is required to explore the phenomenon of how their pre-training, and capabili
ties can be used to mitigate the problem of heterogeneity in data and improve the effectiveness of model ag
gregation. Paradigm shift in this federated environment suggested in the recent literature using large lang
uage model will entail simplicity of data integration and complete utilization of large language model to a
ttain better results, but, at the expense of augmented communication due to large parameter sizes. (Béguier

icular focus on privacy-preserving tools and their impact on the model results. It reviews as well a number
 of strategies of how to solve the challenges of data heterogeneity, communication efficiency and equity in
 federated recommender systems and how the rating bias is effectively handled by the models. The latest inn
ovations in federated learning as a recommendation system, such as FedRec and FCF, have primarily focused o
n matrix-factorization-based collaborative filtering, and FedMF also has a homomorphic encryption transmiss
ion of the gradients. Regardless of such developments, the majority of the existing literature is inclined
 to disapprove of the multifacetedness of the challenges of fairness, prejudice, and the threat to the integ
rity of the systems that play a fundamental role in generating effective and robust recommender systems. Ev
en though some of the literature attempts to enhance effectiveness of federated recommender system by sugge
sting mechanisms through which convergence can be expedited or lightweight communication based on lightweig
ht communication is offered, a holistic understanding of veracity and faithfulness of federated recommender
 system with various model of attacks is yet to be accomplished as a research. Moreover, one of the opportu
nities of higher performance and privacy facilitated by the adoption of foundation models in federated reco
mmendation systems is the fact that the technology is still in its infancy. More specifically, they apply t
heir massive pre-training knowledge in the models to improve the quality of the recommendations and federat
ed learning is used to make the sensitive user interaction data fed to fine-tune the models local. However,
 to fully incorporate the opportunities suggested by the foundation models in federated recommendation syst
ems, a novel area of research is required to explore the phenomenon of how their pre-training, and capabili
ties can be used to mitigate the problem of heterogeneity in data and improve the effectiveness of model ag
gregation. Paradigm shift in this federated environment suggested in the recent literature using large lang
uage model will entail simplicity of data integration and complete utilization of large language model to a
ttain better results, but, at the expense of augmented communication due to large parameter sizes. (Béguier

hub.com/citation-style-language/schema/raw/master/csl-citation.json\"} The section under consideration eval
uates the literature content related to federated learning in reference to recommendation systems with part
icular focus on privacy-preserving tools and their impact on the model results. It reviews as well a number
 of strategies of how to solve the challenges of data heterogeneity, communication efficiency and equity in
 federated recommender systems and how the rating bias is effectively handled by the models. The latest inn
ovations in federated learning as a recommendation system, such as FedRec and FCF, have primarily focused o
n matrix-factorization-based collaborative filtering, and FedMF also has a homomorphic encryption transmiss
ion of the gradients. Regardless of such developments, the majority of the existing literature is inclined
to disapprove of the multifacetedness of the challenges of fairness, prejudice, and the threat to the integ
rity of the systems that play a fundamental role in generating effective and robust recommender systems. Ev
en though some of the literature attempts to enhance effectiveness of federated recommender system by sugge
sting mechanisms through which convergence can be expedited or lightweight communication based on lightweig
ht communication is offered, a holistic understanding of veracity and faithfulness of federated recommender
 system with various model of attacks is yet to be accomplished as a research. Moreover, one of the opportu
nities of higher performance and privacy facilitated by the adoption of foundation models in federated reco
mmendation systems is the fact that the technology is still in its infancy. More specifically, they apply t
heir massive pre-training knowledge in the models to improve the quality of the recommendations and federat
ed learning is used to make the sensitive user interaction data fed to fine-tune the models local. However,
 to fully incorporate the opportunities suggested by the foundation models in federated recommendation syst
ems, a novel area of research is required to explore the phenomenon of how their pre-training, and capabili
ties can be used to mitigate the problem of heterogeneity in data and improve the effectiveness of model ag
gregation. Paradigm shift in this federated environment suggested in the recent literature using large lang
uage model will entail simplicity of data integration and complete utilization of large language model to a
ttain better results, but, at the expense of augmented communication due to large parameter sizes. (Béguier

In this part, the available literature on the topic of federated learning mechanism in recommendation systems is presented and, in particular, the privacy-saving mechanisms and their impact on the performance of the model are discussed. It also dwells into various mechanisms of coping with such problems as heterogeneity of data, efficiency of communication and equity of federated recommender systems and how the models can be utilized to effectively deal with the problem of rating bias. Recent trends in federated learning as a recommendation system which include FedRec and FCF, has largely focused on collaborative filtering and matrix factorization of the matrices FedMF also incorporates a homomorphic encoding aspect to transmit gradients in a secure manner. In spite of such developments, many of the existing studies are inclined to dwell on the primitive aspects of equity, bigotry, and risks to system integrity, which play a vital role in the formulation of effective and trustworthy recommender systems. However, the research of fairness, integrity in the circumstances of various attacks is an active research question in spite of the particularity of other studies aimed at enhancing the efficiency of federated recommender systems by accelerating convergence or by using light-weight communication schemes. In addition to that, the foundation models supported by federated recommendation systems represent a shining light to high-performance and privacy despite the fact that the sphere is still at its initial developmental phases. Precisely, the models, on the one hand, take advantages of their widely computerised pre-training knowledge in order to better the quality of the recommendations in which also federated learning maintains the sensitive user interaction data utilised in a fine-tuning process localised. However, the complete capacity of foundation models to the federated recommendation system is achieved with the perception of how their pre-training capabilities can be applied to address the problem of data heterogeneity and serve to optimize the effectiveness of model aggregation. Whereas the recent literature suggests as an application of large language models, the idea of large language models in such a federated structure suggests rather a change in the thinking of data integration, which is not necessitating a complete utilization of the large language models but suggests that it will be driven by a paradigm shift to the complete utilization of the large parameters in data integration at an increased communication cost. ,\"issued\":{\"date-parts\":[[\"2025\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema
/raw/master/csl-citation.json\"} In this part, the available literature on the topic of federated learning

mechanism in recommendation systems is presented and, in particular, the privacy-saving mechanisms and thei
r impact on the performance of the model are discussed. It also dwells into various mechanisms of coping wi
th such problems as heterogeneity of data, efficiency of communication and equity of federated recommender
systems and how the models can be utilized to effectively deal with the problem of rating bias. Recent tren
ds in federated learning as a recommendation system which include FedRec and FCF, has largely focused on co
llaborative filtering and matrix factorization of the matrices FedMF also incorporates a homomorphic encodi
ng aspect to transmit gradients in a secure manner. In spite of such developments, many of the existing stu
dies are inclined to dwell on the primitive aspects of equity, bigotry, and risks to system integrity, whic
h play a vital role in the formulation of effective and trustworthy recommender systems. However, the resea
rch of fairness, integrity in the circumstances of various attacks is an active research question in spite
of the particularity of other studies aimed at enhancing the efficiency of federated recommender systems by
 accelerating convergence or by using light-weight communication schemes. In addition to that, the foundati
on models supported by federated recommendation systems represent a shining light to high-performance and p
rivacy despite the fact that the sphere is still at its initial developmental phases. Precisely, the models
, on the one hand, take advantages of their widely computerised pre-training knowledge in order to better t
he quality of the recommendations in which also federated learning maintains the sensitive user interaction
 data utilised in a fine-tuning process localised. However, the complete capacity of foundation models to t
he federated recommendation system is achieved with the perception of how their pre-training capabilities c
an be applied to address the problem of data heterogeneity and serve to optimize the effectiveness of model
 aggregation. Whereas the recent literature suggests as an application of large language models, the idea o
f large language models in such a federated structure suggests rather a change in the thinking of data inte
gration, which is not necessitating a complete utilization of the large language models but suggests that i
t will be driven by a paradigm shift to the complete utilization of the large parameters in data integratio
n at an increased communication cost. (Z. Chen et al., 2022c; H. Dai et al., 2024; Y. Ding et al., 2024; H.

ds in federated learning as a recommendation system which include FedRec and FCF, has largely focused on co
llaborative filtering and matrix factorization of the matrices FedMF also incorporates a homomorphic encodi
ng aspect to transmit gradients in a secure manner. In spite of such developments, many of the existing stu
dies are inclined to dwell on the primitive aspects of equity, bigotry, and risks to system integrity, whic
h play a vital role in the formulation of effective and trustworthy recommender systems. However, the resea
rch of fairness, integrity in the circumstances of various attacks is an active research question in spite
of the particularity of other studies aimed at enhancing the efficiency of federated recommender systems by
 accelerating convergence or by using light-weight communication schemes. In addition to that, the foundati
on models supported by federated recommendation systems represent a shining light to high-performance and p
rivacy despite the fact that the sphere is still at its initial developmental phases. Precisely, the models
, on the one hand, take advantages of their widely computerised pre-training knowledge in order to better t
he quality of the recommendations in which also federated learning maintains the sensitive user interaction
 data utilised in a fine-tuning process localised. However, the complete capacity of foundation models to t
he federated recommendation system is achieved with the perception of how their pre-training capabilities c
an be applied to address the problem of data heterogeneity and serve to optimize the effectiveness of model
 aggregation. Whereas the recent literature suggests as an application of large language models, the idea o
f large language models in such a federated structure suggests rather a change in the thinking of data inte
gration, which is not necessitating a complete utilization of the large language models but suggests that i
t will be driven by a paradigm shift to the complete utilization of the large parameters in data integratio
n at an increased communication cost. (Z. Chen et al., 2022c; H. Dai et al., 2024; Y. Ding et al., 2024; H.

,\"issued\":{\"date-parts\":[[\"2025\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema
/raw/master/csl-citation.json\"} In this part, the available literature on the topic of federated learning
mechanism in recommendation systems is presented and, in particular, the privacy-saving mechanisms and thei
r impact on the performance of the model are discussed. It also dwells into various mechanisms of coping wi
th such problems as heterogeneity of data, efficiency of communication and equity of federated recommender
systems and how the models can be utilized to effectively deal with the problem of rating bias. Recent tren
ds in federated learning as a recommendation system which include FedRec and FCF, has largely focused on co
llaborative filtering and matrix factorization of the matrices FedMF also incorporates a homomorphic encodi
ng aspect to transmit gradients in a secure manner. In spite of such developments, many of the existing stu
dies are inclined to dwell on the primitive aspects of equity, bigotry, and risks to system integrity, whic
h play a vital role in the formulation of effective and trustworthy recommender systems. However, the resea
rch of fairness, integrity in the circumstances of various attacks is an active research question in spite
of the particularity of other studies aimed at enhancing the efficiency of federated recommender systems by
 accelerating convergence or by using light-weight communication schemes. In addition to that, the foundati
on models supported by federated recommendation systems represent a shining light to high-performance and p
rivacy despite the fact that the sphere is still at its initial developmental phases. Precisely, the models
, on the one hand, take advantages of their widely computerised pre-training knowledge in order to better t
he quality of the recommendations in which also federated learning maintains the sensitive user interaction
 data utilised in a fine-tuning process localised. However, the complete capacity of foundation models to t
he federated recommendation system is achieved with the perception of how their pre-training capabilities c
an be applied to address the problem of data heterogeneity and serve to optimize the effectiveness of model
 aggregation. Whereas the recent literature suggests as an application of large language models, the idea o
f large language models in such a federated structure suggests rather a change in the thinking of data inte
gration, which is not necessitating a complete utilization of the large language models but suggests that i
t will be driven by a paradigm shift to the complete utilization of the large parameters in data integratio
n at an increased communication cost. (Z. Chen et al., 2022c; H. Dai et al., 2024; Y. Ding et al., 2024; H.

,\"issued\":{\"date-parts\":[[\"2025\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema
/raw/master/csl-citation.json\"} In this part, the available literature on the topic of federated learning
mechanism in recommendation systems is presented and, in particular, the privacy-saving mechanisms and thei
r impact on the performance of the model are discussed. It also dwells into various mechanisms of coping wi
th such problems as heterogeneity of data, efficiency of communication and equity of federated recommender
systems and how the models can be utilized to effectively deal with the problem of rating bias. Recent tren
ds in federated learning as a recommendation system which include FedRec and FCF, has largely focused on co
llaborative filtering and matrix factorization of the matrices FedMF also incorporates a homomorphic encodi
ng aspect to transmit gradients in a secure manner. In spite of such developments, many of the existing stu

dies are inclined to dwell on the primitive aspects of equity, bigotry, and risks to system integrity, whic
h play a vital role in the formulation of effective and trustworthy recommender systems. However, the resea
rch of fairness, integrity in the circumstances of various attacks is an active research question in spite
of the particularity of other studies aimed at enhancing the efficiency of federated recommender systems by
 accelerating convergence or by using light-weight communication schemes. In addition to that, the foundati
on models supported by federated recommendation systems represent a shining light to high-performance and p
rivacy despite the fact that the sphere is still at its initial developmental phases. Precisely, the models
, on the one hand, take advantages of their widely computerised pre-training knowledge in order to better t
he quality of the recommendations in which also federated learning maintains the sensitive user interaction
 data utilised in a fine-tuning process localised. However, the complete capacity of foundation models to t
he federated recommendation system is achieved with the perception of how their pre-training capabilities c
an be applied to address the problem of data heterogeneity and serve to optimize the effectiveness of model
 aggregation. Whereas the recent literature suggests as an application of large language models, the idea o
f large language models in such a federated structure suggests rather a change in the thinking of data inte
gration, which is not necessitating a complete utilization of the large language models but suggests that i
t will be driven by a paradigm shift to the complete utilization of the large parameters in data integratio
n at an increased communication cost. (Z. Chen et al., 2022c; H. Dai et al., 2024; Y. Ding et al., 2024; H.

It also dwells into various mechanisms of coping with such problems as heterogeneity of data, efficiency of communication and equity of federated recommender systems and how the models can be utilized to effectively deal with the problem of rating bias. Recent trends in federated learning as a recommendation system which include FedRec and FCF, has largely focused on collaborative filtering and matrix factorization of the matrices FedMF also incorporates a homomorphic encoding aspect to transmit gradients in a secure manner. In spite of such developments, many of the existing studies are inclined to dwell on the primitive aspects of equity, bigotry, and risks to system integrity, which play a vital role in the formulation of effective and trustworthy recommender systems. However, the research of fairness, integrity in the circumstances of various attacks is an active research question in spite of the particularity of other studies aimed at enhancing the efficiency of federated recommender systems by accelerating convergence or by using light-weight communication schemes. In addition to that, the foundation models supported by federated recommendation systems represent a shining light to high-performance and privacy despite the fact that the sphere is still at its initial developmental phases. Precisely, the models, on the one hand, take advantages of their widely computerised pre-training knowledge in order to better the quality of the recommendations in which also federated learning maintains the sensitive user interaction data utilised in a fine-tuning process localised. However, the complete capacity of foundation models to the federated recommendation system is achieved with the perception of how their pre-training capabilities can be applied to address the problem of data heterogeneity and serve to optimize the effectiveness of model aggregation. Whereas the recent literature suggests as an application of large language models, the idea of large language models in such a federated structure suggests rather a change in the thinking of data integration, which is not necessitating a complete utilization of the large language models but suggests that it will be driven by a paradigm shift to the complete utilization of the large parameters in data integration at an increased communication cost. In this part, the available literature on the topic of federated learning mechanism in recommendation systems is presented and, in particular, the privacy-saving mechanisms and their impact on the performance of the model are discussed. It also dwells into various mechanisms of coping with such problems as heterogeneity of data, efficiency of communication and equity of federated recommender systems and how the models can be utilized to effectively deal with the problem of rating bias. Recent trends in federated learning as a recommendation system which include FedRec and FCF, has largely focused on collaborative filtering and matrix factorization of the matrices FedMF also incorporates a homomorphic encoding aspect to transmit gradients in a secure manner. In spite of such developments, many of the existing studies are inclined to dwell on the primitive aspects of equity, bigotry, and risks to system integrity, which play a vital role in the formulation of effective and trustworthy recommender systems. However, the research of fairness, integrity in the circumstances of various attacks is an active research question in spite of the particularity of other studies aimed at enhancing the efficiency of federated recommender systems by accelerating convergence or by using light-weight communication schemes. In addition to that, the foundation models supported by federated recommendation systems represent a shining light to high-performance and p

rivacy despite the fact that the sphere is still at its initial developmental phases. Precisely, the models
, on the one hand, take advantages of their widely computerised pre-training knowledge in order to better t
he quality of the recommendations in which also federated learning maintains the sensitive user interaction
 data utilised in a fine-tuning process localised. However, the complete capacity of foundation models to t
he federated recommendation system is achieved with the perception of how their pre-training capabilities c
an be applied to address the problem of data heterogeneity and serve to optimize the effectiveness of model
 aggregation. Whereas the recent literature suggests as an application of large language models, the idea o
f large language models in such a federated structure suggests rather a change in the thinking of data inte
gration, which is not necessitating a complete utilization of the large language models but suggests that i
t will be driven by a paradigm shift to the complete utilization of the large parameters in data integratio
n at an increased communication cost. (Z. Chen et al., 2022c; H. Dai et al., 2024; Y. Ding et al., 2024; H.

,\"issued\":{\"date-parts\":[[\"2025\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema
/raw/master/csl-citation.json\"} In this part, the available literature on the topic of federated learning
mechanism in recommendation systems is presented and, in particular, the privacy-saving mechanisms and thei
r impact on the performance of the model are discussed. It also dwells into various mechanisms of coping wi
th such problems as heterogeneity of data, efficiency of communication and equity of federated recommender
systems and how the models can be utilized to effectively deal with the problem of rating bias. Recent tren
ds in federated learning as a recommendation system which include FedRec and FCF, has largely focused on co
llaborative filtering and matrix factorization of the matrices FedMF also incorporates a homomorphic encodi
ng aspect to transmit gradients in a secure manner. In spite of such developments, many of the existing stu
dies are inclined to dwell on the primitive aspects of equity, bigotry, and risks to system integrity, whic
h play a vital role in the formulation of effective and trustworthy recommender systems. However, the resea
rch of fairness, integrity in the circumstances of various attacks is an active research question in spite
of the particularity of other studies aimed at enhancing the efficiency of federated recommender systems by
 accelerating convergence or by using light-weight communication schemes. In addition to that, the foundati
on models supported by federated recommendation systems represent a shining light to high-performance and p
rivacy despite the fact that the sphere is still at its initial developmental phases. Precisely, the models
, on the one hand, take advantages of their widely computerised pre-training knowledge in order to better t
he quality of the recommendations in which also federated learning maintains the sensitive user interaction
 data utilised in a fine-tuning process localised. However, the complete capacity of foundation models to t
he federated recommendation system is achieved with the perception of how their pre-training capabilities c
an be applied to address the problem of data heterogeneity and serve to optimize the effectiveness of model
 aggregation. Whereas the recent literature suggests as an application of large language models, the idea o
f large language models in such a federated structure suggests rather a change in the thinking of data inte
gration, which is not necessitating a complete utilization of the large language models but suggests that i
t will be driven by a paradigm shift to the complete utilization of the large parameters in data integratio
n at an increased communication cost. (Z. Chen et al., 2022c; H. Dai et al., 2024; Y. Ding et al., 2024; H.

/raw/master/csl-citation.json\"} In this part, the available literature on the topic of federated learning 
mechanism in recommendation systems is presented and, in particular, the privacy-saving mechanisms and thei
r impact on the performance of the model are discussed. It also dwells into various mechanisms of coping wi
th such problems as heterogeneity of data, efficiency of communication and equity of federated recommender 
systems and how the models can be utilized to effectively deal with the problem of rating bias. Recent tren
ds in federated learning as a recommendation system which include FedRec and FCF, has largely focused on co
llaborative filtering and matrix factorization of the matrices FedMF also incorporates a homomorphic encodi
ng aspect to transmit gradients in a secure manner. In spite of such developments, many of the existing stu
dies are inclined to dwell on the primitive aspects of equity, bigotry, and risks to system integrity, whic
h play a vital role in the formulation of effective and trustworthy recommender systems. However, the resea
rch of fairness, integrity in the circumstances of various attacks is an active research question in spite 
of the particularity of other studies aimed at enhancing the efficiency of federated recommender systems by
 accelerating convergence or by using light-weight communication schemes. In addition to that, the foundati
on models supported by federated recommendation systems represent a shining light to high-performance and p
rivacy despite the fact that the sphere is still at its initial developmental phases. Precisely, the models
, on the one hand, take advantages of their widely computerised pre-training knowledge in order to better t
he quality of the recommendations in which also federated learning maintains the sensitive user interaction
 data utilised in a fine-tuning process localised. However, the complete capacity of foundation models to t
he federated recommendation system is achieved with the perception of how their pre-training capabilities c
an be applied to address the problem of data heterogeneity and serve to optimize the effectiveness of model
 aggregation. Whereas the recent literature suggests as an application of large language models, the idea o
f large language models in such a federated structure suggests rather a change in the thinking of data inte
gration, which is not necessitating a complete utilization of the large language models but suggests that i
t will be driven by a paradigm shift to the complete utilization of the large parameters in data integratio
n at an increased communication cost. (Z. Chen et al., 2022c; H. Dai et al., 2024; Y. Ding et al., 2024; H.
