pe\":\"article-journal\",\"abstract\":\"Recommender systems (RSs)\\n              have become an inseparabl
e part of our everyday lives. They help us find our favorite items to purchase, our friends on social netwo
rks, and our favorite movies to watch. Traditionally, the recommendation problem was considered to be a cla
ssification or prediction problem, but it is now widely agreed that formulating it as a sequential decision
 problem can better reflect the user-system interaction. Therefore, it can be formulated as a\\n
   Markov decision process (MDP)\\n              and be solved by\\n              reinforcement learning (R
L)\\n              algorithms. Unlike traditional recommendation methods, including collaborative filtering
 and content-based filtering, RL is able to handle the sequential, dynamic user-system interaction and to t
ake into account the long-term user engagement. Although the idea of using RL for recommendation is not new
 and has been around for about two decades, it was not very practical, mainly because of scalability proble
ms of traditional RL algorithms. However, a new trend has emerged in the field since the introduction of\\n
              deep reinforcement learning (DRL)\\n              , which made it possible to apply RL to the
 recommendation problem with large state and action spaces. In this paper, a survey on\\n              rein
forcement learning based recommender systems (RLRSs)\\n              is presented. Our aim is to present an
 outlook on the field and to provide the reader with a fairly complete knowledge of key concepts of the fie
ld. We first recognize and illustrate that RLRSs can be generally classified into RL- and DRL-based methods
. Then, we propose an RLRS framework with four components, i.e., state representation, policy optimization,
 reward formulation, and environment building, and survey RLRS algorithms accordingly. We highlight emergin
g topics and depict important trends using various graphs and tables. Finally, we discuss important aspects
 and challenges that can be addressed in the future.\",\"container-title\":\"ACM Computing Surveys\",\"DOI\

pe\":\"article-journal\",\"abstract\":\"Recommender systems (RSs)\\n             have become an inseparabl
e part of our everyday lives. They help us find our favorite items to purchase, our friends on social netwo
rks, and our favorite movies to watch. Traditionally, the recommendation problem was considered to be a cla
ssification or prediction problem, but it is now widely agreed that formulating it as a sequential decision
 problem can better reflect the user-system interaction. Therefore, it can be formulated as a\\n
   Markov decision process (MDP)\\n             and be solved by\\n             reinforcement learning (R
L)\\n             algorithms. Unlike traditional recommendation methods, including collaborative filtering
 and content-based filtering, RL is able to handle the sequential, dynamic user-system interaction and to t
ake into account the long-term user engagement. Although the idea of using RL for recommendation is not new
 and has been around for about two decades, it was not very practical, mainly because of scalability proble
ms of traditional RL algorithms. However, a new trend has emerged in the field since the introduction of\\n
              deep reinforcement learning (DRL)\\n             , which made it possible to apply RL to the
 recommendation problem with large state and action spaces. In this paper, a survey on\\n             rein
forcement learning based recommender systems (RLRSs)\\n             is presented. Our aim is to present an
 outlook on the field and to provide the reader with a fairly complete knowledge of key concepts of the fie
ld. We first recognize and illustrate that RLRSs can be generally classified into RL- and DRL-based methods
. Then, we propose an RLRS framework with four components, i.e., state representation, policy optimization,
 reward formulation, and environment building, and survey RLRS algorithms accordingly. We highlight emergin
g topics and depict important trends using various graphs and tables. Finally, we discuss important aspects
 and challenges that can be addressed in the future.\",\"container-title\":\"ACM Computing Surveys\",\"DOI\

mendation systems are the most important components in the world of technology today, especially Social Med
ia, Netflix, Spotify and wherever there is a need to show users what to interact with and reduce their deci
sion-making efforts. Today’s recommendation systems have overgrown from simple filtering systems to showing
 and recommending users as to what they want and what they will like to interact with so that they don’t or
 to the very least search for their preferred content. Some examples of platforms that use recommendation s
ystems are: Netflix, Amazon, Spotify, YouTube and many more. The purpose of the recommendation system has a
lso overgrown from just recommending users personalized content to retaining them on the platform for as lo
ng as possible and keep them engaged with the platform so that they use the platform more and more. While p
latforms like Netflix and Spotify use recommendation systems to retain the user into their platform and kee
p them engaged keep them busy, social media on the other hand use recommendation systems to show users cont
ent for maximum likes comments shares Etc. (Afsar et al., 2023; Gomez-Uribe \u0026 Hunt, 2016; Raza et al.,

Because the more user engages with the platform, the more engagement with the sponsors or the advertisements or the affiliates will happen and that will help the platform to generate even more money. So for example, in platforms like Instagram and Facebook if the user happens to spend time more than previous day then these platforms have a business model of showing ads and sponsored content. So it is more likely that the user will click on some advertisement or some sponsored content which will lead to platform making more money.. We can quote another example of recommendation system in Amazon which is called frequently bought together. This feature recommends related items which user is interested in. so if user buys an item X and the user is being shown item a b and c.It is likely that user may be interested in at least one of the a b and c and may end up buying any of the recommended items which the user did not intend or did not think of buying previously. so that results in the sellers making more money and Amazon making more money. of classification techniques to utility elicitation. In a decision problem, two sets of parameters must gen
erally be elicited: the probabilities and the utilities. While the prior and conditional probabilities in t
he model do not change from user to user, the utility models do. Thus it is necessary to elicit a utility m
odel separately for each new user. Elicitation is long and tedious, particularly if the outcome space is la
rge and not decomposable. There are two common approaches to utility function elicitation. The first is to 
base the determination of the users utility function solely ON elicitation OF qualitative preferences.The s
econd makes assumptions about the form AND decomposability OF the utility function.Here we take a different
 approach: we attempt TO identify the new USERs utility function based on classification relative to a data
```

base of previously collected utility functions. We do this by identifying clusters of utility functions tha
t minimize an appropriate distance measure. Having identified the clusters, we develop a classification sch
eme that requires many fewer and simpler assessments than full utility elicitation and is more robust than
utility elicitation based solely on preferences. We have tested our algorithm on a small database of utilit
y functions in a prenatal diagnosis domain and the results are quite promising.\",\"DOI\":\"10.48550/arXiv.

"abstract\":\"Low-rank matrix approximations, such as the truncated singular value decomposition and the ra
nk-revealing QR decomposition, play a central role in data analysis and scientific computing. This work sur
veys and extends recent research which demonstrates that randomization offers a powerful tool for performin
g low-rank matrix approximation. These techniques exploit modern computational architectures more fully tha
n classical methods and open the possibility of dealing with truly massive data sets. This paper presents a
 modular framework for constructing randomized algorithms that compute partial matrix decompositions. These
 methods use random sampling to identify a subspace that captures most of the action of a matrix. The input
 matrix is then compressed---either explicitly or implicitly---to this subspace, and the reduced matrix is
manipulated deterministically to obtain the desired low-rank factorization. In many cases, this approach be
ats its classical competitors in terms of accuracy, speed, and robustness. These claims are supported by ex
tensive numerical experiments and a detailed error analysis.\",\"DOI\":\"10.48550/arXiv.0909.4061\",\"note\

ural networks have yielded immense success on speech recognition, computer vision and natural language proc
essing. However, the exploration of deep neural networks on recommender systems has received relatively les
s scrutiny. In this work, we strive to develop techniques based on neural networks to tackle the key proble
m in recommendation -- collaborative filtering -- on the basis of implicit feedback. Although some recent w
ork has employed deep learning for recommendation, they primarily used it to model auxiliary information, s
uch as textual descriptions of items and acoustic features of musics. When it comes to model the key factor
 in collaborative filtering -- the interaction between user and item features, they still resorted to matri
x factorization and applied an inner product on the latent features of users and items. By replacing the in
ner product with a neural architecture that can learn an arbitrary function from data, we present a general
 framework named NCF, short for Neural network-based Collaborative Filtering. NCF is generic and can expres
s and generalize matrix factorization under its framework. To supercharge NCF modelling with non-linearitie
s, we propose to leverage a multi-layer perceptron to learn the user-item interaction function. Extensive e
xperiments on two real-world datasets show significant improvements of our proposed NCF framework over the
state-of-the-art methods. Empirical evidence shows that using deeper layers of neural networks offers bette
r recommendation performance.\",\"DOI\":\"10.48550/arXiv.1708.05031\",\"note\":\"arXiv:1708.05031 [cs]\",\"

"abstract\":\"Low-rank matrix approximations, such as the truncated singular value decomposition and the ra
nk-revealing QR decomposition, play a central role in data analysis and scientific computing. This work sur
veys and extends recent research which demonstrates that randomization offers a powerful tool for performin
g low-rank matrix approximation. These techniques exploit modern computational architectures more fully tha
n classical methods and open the possibility of dealing with truly massive data sets. This paper presents a
 modular framework for constructing randomized algorithms that compute partial matrix decompositions. These
 methods use random sampling to identify a subspace that captures most of the action of a matrix. The input
 matrix is then compressed---either explicitly or implicitly---to this subspace, and the reduced matrix is
manipulated deterministically to obtain the desired low-rank factorization. In many cases, this approach be
ats its classical competitors in terms of accuracy, speed, and robustness. These claims are supported by ex
tensive numerical experiments and a detailed error analysis.\",\"DOI\":\"10.48550/arXiv.0909.4061\",\"note\

ural networks have yielded immense success on speech recognition, computer vision and natural language proc
essing. However, the exploration of deep neural networks on recommender systems has received relatively les
s scrutiny. In this work, we strive to develop techniques based on neural networks to tackle the key proble
m in recommendation -- collaborative filtering -- on the basis of implicit feedback. Although some recent w
ork has employed deep learning for recommendation, they primarily used it to model auxiliary information, s
uch as textual descriptions of items and acoustic features of musics. When it comes to model the key factor
 in collaborative filtering -- the interaction between user and item features, they still resorted to matri
x factorization and applied an inner product on the latent features of users and items. By replacing the in
ner product with a neural architecture that can learn an arbitrary function from data, we present a general
 framework named NCF, short for Neural network-based Collaborative Filtering. NCF is generic and can expres
s and generalize matrix factorization under its framework. To supercharge NCF modelling with non-linearitie
s, we propose to leverage a multi-layer perceptron to learn the user-item interaction function. Extensive e
xperiments on two real-world datasets show significant improvements of our proposed NCF framework over the
state-of-the-art methods. Empirical evidence shows that using deeper layers of neural networks offers bette

Applying large pre-trained Vision-Language Models to recommendation is a burgeoning field, a direction we t
erm Vision-Language-Recommendation (VLR). Bringing VLR to user-oriented on-device intelligence within a fed
erated learning framework is a crucial step for enhancing user privacy and delivering personalized experien
ces. This paper introduces FedVLR, a federated VLR framework specially designed for user-specific personali
zed fusion of vision-language representations. At its core is a novel bi-level fusion mechanism: The server
-side multi-view fusion module first generates a diverse set of pre-fused multimodal views. Subsequently, e
ach client employs a user-specific mixture-of-expert mechanism to adaptively integrate these views based on
 individual user interaction history. This designed lightweight personalized fusion module provides an effi
cient solution to implement a federated VLR system. The effectiveness of our proposed FedVLR has been valid
ated on seven benchmark datasets.\",\"DOI\":\"10.48550/arXiv.2410.08478\",\"note\":\"arXiv:2410.08478 [cs]\

Applying large pre-trained Vision-Language Models to recommendation is a burgeoning field, a direction we t
erm Vision-Language-Recommendation (VLR). Bringing VLR to user-oriented on-device intelligence within a fed
erated learning framework is a crucial step for enhancing user privacy and delivering personalized experien
ces. This paper introduces FedVLR, a federated VLR framework specially designed for user-specific personali
zed fusion of vision-language representations. At its core is a novel bi-level fusion mechanism: The server
-side multi-view fusion module first generates a diverse set of pre-fused multimodal views. Subsequently, e
ach client employs a user-specific mixture-of-expert mechanism to adaptively integrate these views based on
 individual user interaction history. This designed lightweight personalized fusion module provides an effi
cient solution to implement a federated VLR system. The effectiveness of our proposed FedVLR has been valid
ated on seven benchmark datasets.\",\"DOI\":\"10.48550/arXiv.2410.08478\",\"note\":\"arXiv:2410.08478 [cs]\

bstract\":\"With the ever-growing volume of online information, recommender systems have been an effective
strategy to overcome such information overload. The utility of recommender systems cannot be overstated, gi
ven its widespread adoption in many web applications, along with its potential impact to ameliorate many pr
oblems related to over-choice. In recent years, deep learning has garnered considerable interest in many re
search fields such as computer vision and natural language processing, owing not only to stellar performanc
e but also the attractive property of learning feature representations from scratch. The influence of deep
learning is also pervasive, recently demonstrating its effectiveness when applied to information retrieval
and recommender systems research. Evidently, the field of deep learning in recommender system is flourishin
g. This article aims to provide a comprehensive review of recent research efforts on deep learning based re
commender systems. More concretely, we provide and devise a taxonomy of deep learning based recommendation
models, along with providing a comprehensive summary of the state-of-the-art. Finally, we expand on current
 trends and provide new perspectives pertaining to this new exciting development of the field.\",\"containe

tation-style-language/schema/raw/master/csl-citation.json\"} Let’s talk a little bit about how the recommen
dation system actually works. The conventional way is that the users data the data which is for example use
rs likes, user comments, users favourite things, users preferred bought items ACC. These data has to be tak
en to a central server where the server processes this data and recommends the user based upon the data tha
t the user generates. The user generates a lot of data depending upon the time and interaction. Even though
 from user standpoint it is just a simple like or it is just a simple comment which does not do anything to
 the user but it is a very useful data to the platform that the user is interacting with. So this all data
has to be taken to central server in order to recommend more things and more content and more items to the
user. This is how most of the company’s work and most of the platforms work. If we name, if we start to nam
e, let’s say Facebook or Instagram, they all collect data and take them to their central servers, which are
 far away from the place where user is using it or at least far away from the users own device. Tender cent
ral servers or central platforms, they process this data, they process all this users likes and comments an
d shares etc, and they applied algorithm to the data to generate more recommendations that is then brought
back to the users device. The user then sees his recommendations and most likely interacts with the recomme
ndations. So for example in the frequently bought items of Amazon user may buy one of the recommended items
 and the and the bought item is another data which then goes to Amazon central servers and then it adds to
the already users data that is present in the central server and the algorithm adapts to the new data that
has come and the cycle goes on. The new data then generates a new recommendation content and the cycle goes
 on and the recommendation improves centrally. (Chajewska et al., 2013; H.-T. Cheng et al., 2016; Halko et

of classification techniques to utility elicitation. In a decision problem, two sets of parameters must gen
erally be elicited: the probabilities and the utilities. While the prior and conditional probabilities in t
he model do not change from user to user, the utility models do. Thus it is necessary to elicit a utility m
odel separately for each new user. Elicitation is long and tedious, particularly if the outcome space is la
rge and not decomposable. There are two common approaches to utility function elicitation. The first is to
base the determination of the users utility function solely ON elicitation OF qualitative preferences.The s
econd makes assumptions about the form AND decomposability OF the utility function.Here we take a different
 approach: we attempt TO identify the new USERs utility function based on classification relative to a data
base of previously collected utility functions. We do this by identifying clusters of utility functions tha
t minimize an appropriate distance measure. Having identified the clusters, we develop a classification sch
eme that requires many fewer and simpler assessments than full utility elicitation and is more robust than
utility elicitation based solely on preferences. We have tested our algorithm on a small database of utilit
y functions in a prenatal diagnosis domain and the results are quite promising.\",\"DOI\":\"10.48550/arXiv.

of classification techniques to utility elicitation. In a decision problem, two sets of parameters must gen
erally be elicited: the probabilities and the utilities. While the prior and conditional probabilities in t
he model do not change from user to user, the utility models do. Thus it is necessary to elicit a utility m
odel separately for each new user. Elicitation is long and tedious, particularly if the outcome space is la
rge and not decomposable. There are two common approaches to utility function elicitation. The first is to
base the determination of the users utility function solely ON elicitation OF qualitative preferences.The s
econd makes assumptions about the form AND decomposability OF the utility function.Here we take a different
 approach: we attempt TO identify the new USERs utility function based on classification relative to a data

base of previously collected utility functions. We do this by identifying clusters of utility functions that minimize an appropriate distance measure. Having identified the clusters, we develop a classification scheme that requires many fewer and simpler assessments than full utility elicitation and is more robust than utility elicitation based solely on preferences. We have tested our algorithm on a small database of utility functions in a prenatal diagnosis domain and the results are quite promising.\",\"DOI\":\"10.48550/arXiv.1301.7367\",\"note\":\"arXiv:1301.7367 [cs]\",\"number\":\"arXiv:1301.7367\",\"publisher\":\"arXiv\",\"source\":\"arXiv.org\",\"title\":\"Utility Elicitation as a Classification Problem\",\"URL\":\"http://arxiv.org/abs/1301.7367\",\"author\":[{\"family\":\"Chajewska\",\"given\":\"Urszula\"},{\"family\":\"Getoor\",\"given\":\"Lise\"},{\"family\":\"Norman\",\"given\":\"Joseph\"},{\"family\":\"Shahar\",\"given\":\"Yuval\"}],\"accessed\":{\"date-parts\":[[\"2026\",2,16]]},\"issued\":{\"date-parts\":[[\"2013\",1,30]]}}},{\"id\":124,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/IXSJIXLL\"],\"itemData\":{\"id\":124,\"type\":\"article\",\"abstract\":\"Generalized linear models with nonlinear feature transformations are widely used for large-scale regression and classification problems with sparse inputs. Memorization of feature interactions through a wide set of cross-product feature transformations are effective and interpretable, while generalization requires more feature engineering effort. With less feature engineering, deep neural networks can generalize better to unseen feature combinations through low-dimensional dense embeddings learned for the sparse features. However, deep neural networks with embeddings can over-generalize and recommend less relevant items when the user-item interactions are sparse and high-rank. In this paper, we present Wide \u0026 Deep learning---jointly trained wide linear models and deep neural networks---to combine the benefits of memorization and generalization for recommender systems. We productionized and evaluated the system on Google Play, a commercial mobile app store with over one billion active users and over one million apps. Online experiment results show that Wide \u0026 Deep significantly increased app acquisitions compared with wide-only and deep-only models. We have also open-sourced our implementation in TensorFlow.\",\"DOI\":\"10.48550/arXiv.1606.07792\",\"note\":\"arXiv:1606.07792 [cs]\",\"number\":\"arXiv:1606.07792\",\"publisher\":\"arXiv\",\"source\":\"arXiv.org\",\"title\":\"Wide \u0026 Deep Learning for Recommender Systems\",\"URL\":\"http://arxiv.org/abs/1606.07792\",\"author\":[{\"family\":\"Cheng\",\"given\":\"Heng-Tze\"},{\"family\":\"Koc\",\"given\":\"Levent\"},{\"family\":\"Harmsen\",\"given\":\"Jeremiah\"},{\"family\":\"Shaked\",\"given\":\"Tal\"},{\"family\":\"Chandra\",\"given\":\"Tushar\"},{\"family\":\"Aradhye\",\"given\":\"Hrishi\"},{\"family\":\"Anderson\",\"given\":\"Glen\"},{\"family\":\"Corrado\",\"given\":\"Greg\"},{\"family\":\"Chai\",\"given\":\"Wei\"},{\"family\":\"Ispir\",\"given\":\"Mustafa\"},{\"family\":\"Anil\",\"given\":\"Rohan\"},{\"family\":\"Haque\",\"given\":\"Zakaria\"},{\"family\":\"Hong\",\"given\":\"Lichan\"},{\"family\":\"Jain\",\"given\":\"Vihan\"},{\"family\":\"Liu\",\"given\":\"Xiaobing\"},{\"family\":\"Shah\",\"given\":\"Hemal\"}],\"accessed\":{\"date-parts\":[[\"2026\",2,16]]},\"issued\":{\"date-parts\":[[\"2016\",6,24]]}}},{\"id\":117,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/L4VQ4CFL\"],\"itemData\":{\"id\":117,\"type\":\"article\",\"abstract\":\"Low-rank matrix approximations, such as the truncated singular value decomposition and the rank-revealing QR decomposition, play a central role in data analysis and scientific computing. This work surveys and extends recent research which demonstrates that randomization offers a powerful tool for performing low-rank matrix approximation. These techniques exploit modern computational architectures more fully than classical methods and open the possibility of dealing with truly massive data sets. This paper presents a modular framework for constructing randomized algorithms that compute partial matrix decompositions. These methods use random sampling to identify a subspace that captures most of the action of a matrix. The input matrix is then compressed---either explicitly or implicitly---to this subspace, and the reduced matrix is manipulated deterministically to obtain the desired low-rank factorization. In many cases, this approach beats its classical competitors in terms of accuracy, speed, and robustness. These claims are supported by extensive numerical experiments and a detailed error analysis.\",\"DOI\":\"10.48550/arXiv.0909.4061\",\"note\":\"arXiv:0909.4061 [math]\",\"number\":\"arXiv:0909.4061\",\"publisher\":\"arXiv\",\"source\":\"arXiv.org\",\"title\":\"Finding structure with randomness: Probabilistic algorithms for constructing approximate matrix decompositions\",\"title-short\":\"Finding structure with randomness\",\"URL\":\"http://arxiv.org/abs/0909.4061\",\"author\":[{\"family\":\"Halko\",\"given\":\"Nathan\"},{\"family\":\"Martinsson\",\"given\":\"Per-Gunnar\"},{\"family\":\"Tropp\",\"given\":\"Joel A.\"}],\"accessed\":{\"date-parts\":[[\"2026\",2,16]]},\"issued\":{\"date-parts\":[[\"2010\",12,14]]}}},{\"id\":120,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/HBUKBJ59\"],\"itemData\":{\"id\":120,\"type\":\"article\",\"abstract\":\"In recent years, deep neural networks have yielded immense success on speech recognition, computer vision and natural language processing. However, the exploration of deep neural networks on recommender systems has received relatively less scrutiny. In this work, we strive to develop techniques based on neural networks to tackle the key problem in recommendation -- collaborative filtering -- on the basis of implicit feedback. Although some recent work has employed deep learning for recommendation, they primarily used it to model auxiliary information, such as textual descriptions of items and acoustic features of musics. When it comes to model the key factor in collaborative filtering -- the interaction between user and item features, they still resorted to matrix factorization and applied an inner product on the latent features of users and items. By replacing the inner product with a neural architecture that can learn an arbitrary function from data, we present a general framework named NCF, short for Neural network-based Collaborative Filtering. NCF is generic and can express and generalize matrix factorization under its framework. To supercharge NCF modelling with non-linearities, we propose to leverage a multi-layer perceptron to learn the user-item interaction function. Extensive experiments on two real-world datasets show significant improvements of our proposed NCF framework over the state-of-the-art methods. Empirical evidence shows that using deeper layers of neural networks offers better recommendation performance.\",\"DOI\":\"10.48550/arXiv.1708.05031\",\"note\":\"arXiv:1708.05031 [cs]\",\"number\":\"arXiv:1708.05031\",\"publisher\":\"arXiv\",\"source\":\"arXiv.org\",\"title\":\"Neural Collaborative Filtering\",\"URL\":\"http://arxiv.org/abs/1708.05031\",\"author\":[{\"family\":\"He\",\"given\":\"Xiangnan\"},{\"family\":\"Liao\",\"given\":\"Lizi\"},{\"family\":\"Zhang\",\"given\":\"Hanwang\"},{\"family\":\"Nie\",\"given\":\"Liqiang\"},{\"family\":\"Hu\",\"given\":\"Xia\"},{\"family\":\"Chua\",\"given\":\"Tat-Seng\"}],\"accessed\":{\"date-parts\":[[\"2026\",2,16]]},\"issued\":{\"date-parts\":[[\"2017\",8,26]]}}},{\"id\":135,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/4ZXSSBS7\"],\"itemData\":{\"id\":135,\"type\":\"article\",\"abstract\":\"Federated learning (FL) is a machine learning setting where many clients (e

"abstract\":\"Low-rank matrix approximations, such as the truncated singular value decomposition and the ra
nk-revealing QR decomposition, play a central role in data analysis and scientific computing. This work sur
veys and extends recent research which demonstrates that randomization offers a powerful tool for performin
g low-rank matrix approximation. These techniques exploit modern computational architectures more fully tha
n classical methods and open the possibility of dealing with truly massive data sets. This paper presents a
 modular framework for constructing randomized algorithms that compute partial matrix decompositions. These
 methods use random sampling to identify a subspace that captures most of the action of a matrix. The input
```

 matrix is then compressed---either explicitly or implicitly---to this subspace, and the reduced matrix is
manipulated deterministically to obtain the desired low-rank factorization. In many cases, this approach be
ats its classical competitors in terms of accuracy, speed, and robustness. These claims are supported by ex
tensive numerical experiments and a detailed error analysis.\",\"DOI\":\"10.48550/arXiv.0909.4061\",\"note\

ural networks have yielded immense success on speech recognition, computer vision and natural language proc
essing. However, the exploration of deep neural networks on recommender systems has received relatively les
s scrutiny. In this work, we strive to develop techniques based on neural networks to tackle the key proble
m in recommendation -- collaborative filtering -- on the basis of implicit feedback. Although some recent w
ork has employed deep learning for recommendation, they primarily used it to model auxiliary information, s
uch as textual descriptions of items and acoustic features of musics. When it comes to model the key factor
 in collaborative filtering -- the interaction between user and item features, they still resorted to matri
x factorization and applied an inner product on the latent features of users and items. By replacing the in
ner product with a neural architecture that can learn an arbitrary function from data, we present a general
 framework named NCF, short for Neural network-based Collaborative Filtering. NCF is generic and can expres
s and generalize matrix factorization under its framework. To supercharge NCF modelling with non-linearitie
s, we propose to leverage a multi-layer perceptron to learn the user-item interaction function. Extensive e
xperiments on two real-world datasets show significant improvements of our proposed NCF framework over the
state-of-the-art methods. Empirical evidence shows that using deeper layers of neural networks offers bette
r recommendation performance.\",\"DOI\":\"10.48550/arXiv.1708.05031\",\"note\":\"arXiv:1708.05031 [cs]\",\"

Applying large pre-trained Vision-Language Models to recommendation is a burgeoning field, a direction we t
erm Vision-Language-Recommendation (VLR). Bringing VLR to user-oriented on-device intelligence within a fed
erated learning framework is a crucial step for enhancing user privacy and delivering personalized experien
ces. This paper introduces FedVLR, a federated VLR framework specially designed for user-specific personali
zed fusion of vision-language representations. At its core is a novel bi-level fusion mechanism: The server
-side multi-view fusion module first generates a diverse set of pre-fused multimodal views. Subsequently, e

ach client employs a user-specific mixture-of-expert mechanism to adaptively integrate these views based on individual user interaction history. This designed lightweight personalized fusion module provides an efficient solution to implement a federated VLR system. The effectiveness of our proposed FedVLR has been validated on seven benchmark datasets.\",\"DOI\":\"10.48550/arXiv.2410.08478\",\"note\":\"arXiv:2410.08478 [cs]\",\"number\":\"arXiv:2410.08478\",\"publisher\":\"arXiv\",\"source\":\"arXiv.org\",\"title\":\"Federated Vision-Language-Recommendation with Personalized Fusion\",\"URL\":\"http://arxiv.org/abs/2410.08478\",\"author\":[{\"family\":\"Li\",\"given\":\"Zhiwei\"},{\"family\":\"Long\",\"given\":\"Guodong\"},{\"family\":\"Jiang\",\"given\":\"Jing\"},{\"family\":\"Zhang\",\"given\":\"Chengqi\"},{\"family\":\"Yang\",\"given\":\"Qiang\"}],\"accessed\":{\"date-parts\":[[\"2026\",2,16]]},\"issued\":{\"date-parts\":[[\"2025\",11,2]]}}},{\"id\":131,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/N28PRJ4U\"],\"itemData\":{\"id\":131,\"type\":\"article\",\"abstract\":\"Most data for evaluating and training recommender systems is subject to selection biases, either through self-selection by the users or through the actions of the recommendation system itself. In this paper, we provide a principled approach to handling selection biases, adapting models and estimation techniques from causal inference. The approach leads to unbiased performance estimators despite biased data, and to a matrix factorization method that provides substantially improved prediction performance on real-world data. We theoretically and empirically characterize the robustness of the approach, finding that it is highly practical and scalable.\",\"DOI\":\"10.48550/arXiv.1602.05352\",\"note\":\"arXiv:1602.05352 [cs]\",\"number\":\"arXiv:1602.05352\",\"publisher\":\"arXiv\",\"source\":\"arXiv.org\",\"title\":\"Recommendations as Treatments: Debiasing Learning and Evaluation\",\"title-short\":\"Recommendations as Treatments\",\"URL\":\"http://arxiv.org/abs/1602.05352\",\"author\":[{\"family\":\"Schnabel\",\"given\":\"Tobias\"},{\"family\":\"Swaminathan\",\"given\":\"Adith\"},{\"family\":\"Singh\",\"given\":\"Ashudeep\"},{\"family\":\"Chandak\",\"given\":\"Navin\"},{\"family\":\"Joachims\",\"given\":\"Thorsten\"}],\"accessed\":{\"date-parts\":[[\"2026\",2,16]]},\"issued\":{\"date-parts\":[[\"2016\",5,27]]}}},{\"id\":139,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/GAXKR4YJ\"],\"itemData\":{\"id\":139,\"type\":\"article-journal\",\"abstract\":\"With the ever-growing volume of online information, recommender systems have been an effective strategy to overcome such information overload. The utility of recommender systems cannot be overstated, given its widespread adoption in many web applications, along with its potential impact to ameliorate many problems related to over-choice. In recent years, deep learning has garnered considerable interest in many research fields such as computer vision and natural language processing, owing not only to stellar performance but also the attractive property of learning feature representations from scratch. The influence of deep learning is also pervasive, recently demonstrating its effectiveness when applied to information retrieval and recommender systems research. Evidently, the field of deep learning in recommender system is flourishing. This article aims to provide a comprehensive review of recent research efforts on deep learning based recommender systems. More concretely, we provide and devise a taxonomy of deep learning based recommendation models, along with providing a comprehensive summary of the state-of-the-art. Finally, we expand on current trends and provide new perspectives pertaining to this new exciting development of the field.\",\"container-title\":\"ACM Computing Surveys\",\"DOI\":\"10.1145/3285029\",\"ISSN\":\"0360-0300, 1557-7341\",\"issue\":\"1\",\"journalAbbreviation\":\"ACM Comput. Surv.\",\"note\":\"arXiv:1707.07435 [cs]\",\"page\":\"1-38\",\"source\":\"arXiv.org\",\"title\":\"Deep Learning based Recommender System: A Survey and New Perspectives\",\"title-short\":\"Deep Learning based Recommender System\",\"URL\":\"http://arxiv.org/abs/1707.07435\",\"volume\":\"52\",\"author\":[{\"family\":\"Zhang\",\"given\":\"Shuai\"},{\"family\":\"Yao\",\"given\":\"Lina\"},{\"family\":\"Sun\",\"given\":\"Aixin\"},{\"family\":\"Tay\",\"given\":\"Yi\"}],\"accessed\":{\"date-parts\":[[\"2026\",2,16]]},\"issued\":{\"date-parts\":[[\"2020\",1,31]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Let’s talk a little bit about how the recommendation system actually works. The conventional way is that the users data the data which is for example users likes, user comments, users favourite things, users preferred bought items ACC. These data has to be taken to a central server where the server processes this data and recommends the user based upon the data that the user generates. The user generates a lot of data depending upon the time and interaction. Even though from user standpoint it is just a simple like or it is just a simple comment which does not do anything to the user but it is a very useful data to the platform that the user is interacting with. So this all data has to be taken to central server in order to recommend more things and more content and more items to the user. This is how most of the company’s work and most of the platforms work. If we name, if we start to name, let’s say Facebook or Instagram, they all collect data and take them to their central servers, which are far away from the place where user is using it or at least far away from the users own device. Tender central servers or central platforms, they process this data, they process all this users likes and comments and shares etc, and they applied algorithm to the data to generate more recommendations that is then brought back to the users device. The user then sees his recommendations and most likely interacts with the recommendations. So for example in the frequently bought items of Amazon user may buy one of the recommended items and the and the bought item is another data which then goes to Amazon central servers and then it adds to the already users data that is present in the central server and the algorithm adapts to the new data that has come and the cycle goes on. The new data then generates a new recommendation content and the cycle goes on and the recommendation improves centrally. (Chajewska et al., 2013; H.-T. Cheng et al., 2016; Halko et al., 2010; X. Applying large pre-trained Vision-Language Models to recommendation is a burgeoning field, a direction we t
erm Vision-Language-Recommendation (VLR). Bringing VLR to user-oriented on-device intelligence within a fed
erated learning framework is a crucial step for enhancing user privacy and delivering personalized experien
ces. This paper introduces FedVLR, a federated VLR framework specially designed for user-specific personali
zed fusion of vision-language representations. At its core is a novel bi-level fusion mechanism: The server
-side multi-view fusion module first generates a diverse set of pre-fused multimodal views. Subsequently, e
ach client employs a user-specific mixture-of-expert mechanism to adaptively integrate these views based on
 individual user interaction history. This designed lightweight personalized fusion module provides an effi
cient solution to implement a federated VLR system. The effectiveness of our proposed FedVLR has been valid
ated on seven benchmark datasets.\",\"DOI\":\"10.48550/arXiv.2410.08478\",\"note\":\"arXiv:2410.08478 [cs]\

tation-style-language/schema/raw/master/csl-citation.json\"} Let’s talk a little bit about how the recommen
dation system actually works. The conventional way is that the users data the data which is for example use
rs likes, user comments, users favourite things, users preferred bought items ACC. These data has to be tak
en to a central server where the server processes this data and recommends the user based upon the data tha
t the user generates. The user generates a lot of data depending upon the time and interaction. Even though
 from user standpoint it is just a simple like or it is just a simple comment which does not do anything to
 the user but it is a very useful data to the platform that the user is interacting with. So this all data
has to be taken to central server in order to recommend more things and more content and more items to the
user. This is how most of the company’s work and most of the platforms work. If we name, if we start to nam
e, let’s say Facebook or Instagram, they all collect data and take them to their central servers, which are
 far away from the place where user is using it or at least far away from the users own device. Tender cent
ral servers or central platforms, they process this data, they process all this users likes and comments an
d shares etc, and they applied algorithm to the data to generate more recommendations that is then brought
back to the users device. The user then sees his recommendations and most likely interacts with the recomme
ndations. So for example in the frequently bought items of Amazon user may buy one of the recommended items
 and the and the bought item is another data which then goes to Amazon central servers and then it adds to
the already users data that is present in the central server and the algorithm adapts to the new data that
has come and the cycle goes on. The new data then generates a new recommendation content and the cycle goes
 on and the recommendation improves centrally. (Chajewska et al., 2013; H.-T. Cheng et al., 2016; Halko et

of classification techniques to utility elicitation. In a decision problem, two sets of parameters must gen
erally be elicited: the probabilities and the utilities. While the prior and conditional probabilities in t
he model do not change from user to user, the utility models do. Thus it is necessary to elicit a utility m
odel separately for each new user. Elicitation is long and tedious, particularly if the outcome space is la
rge and not decomposable. There are two common approaches to utility function elicitation. The first is to
base the determination of the users utility function solely ON elicitation OF qualitative preferences.The s
econd makes assumptions about the form AND decomposability OF the utility function.Here we take a different
 approach: we attempt TO identify the new USERs utility function based on classification relative to a data
base of previously collected utility functions. We do this by identifying clusters of utility functions tha
t minimize an appropriate distance measure. Having identified the clusters, we develop a classification sch
eme that requires many fewer and simpler assessments than full utility elicitation and is more robust than
utility elicitation based solely on preferences. We have tested our algorithm on a small database of utilit
y functions in a prenatal diagnosis domain and the results are quite promising.\",\"DOI\":\"10.48550/arXiv.

Applying large pre-trained Vision-Language Models to recommendation is a burgeoning field, a direction we t
erm Vision-Language-Recommendation (VLR). Bringing VLR to user-oriented on-device intelligence within a fed
erated learning framework is a crucial step for enhancing user privacy and delivering personalized experien
ces. This paper introduces FedVLR, a federated VLR framework specially designed for user-specific personali
zed fusion of vision-language representations. At its core is a novel bi-level fusion mechanism: The server
-side multi-view fusion module first generates a diverse set of pre-fused multimodal views. Subsequently, e
ach client employs a user-specific mixture-of-expert mechanism to adaptively integrate these views based on
 individual user interaction history. This designed lightweight personalized fusion module provides an effi
cient solution to implement a federated VLR system. The effectiveness of our proposed FedVLR has been valid
ated on seven benchmark datasets.\",\"DOI\":\"10.48550/arXiv.2410.08478\",\"note\":\"arXiv:2410.08478 [cs]\

\":\"article\",\"abstract\":\"Most data for evaluating and training recommender systems is subject to selec
tion biases, either through self-selection by the users or through the actions of the recommendation system
 itself. In this paper, we provide a principled approach to handling selection biases, adapting models and
estimation techniques from causal inference. The approach leads to unbiased performance estimators despite
biased data, and to a matrix factorization method that provides substantially improved prediction performan
ce on real-world data. We theoretically and empirically characterize the robustness of the approach, findin
g that it is highly practical and scalable.\",\"DOI\":\"10.48550/arXiv.1602.05352\",\"note\":\"arXiv:1602.0

bstract\":\"With the ever-growing volume of online information, recommender systems have been an effective
strategy to overcome such information overload. The utility of recommender systems cannot be overstated, gi
ven its widespread adoption in many web applications, along with its potential impact to ameliorate many pr
oblems related to over-choice. In recent years, deep learning has garnered considerable interest in many re
search fields such as computer vision and natural language processing, owing not only to stellar performanc
e but also the attractive property of learning feature representations from scratch. The influence of deep
learning is also pervasive, recently demonstrating its effectiveness when applied to information retrieval
and recommender systems research. Evidently, the field of deep learning in recommender system is flourishin
g. This article aims to provide a comprehensive review of recent research efforts on deep learning based re
commender systems. More concretely, we provide and devise a taxonomy of deep learning based recommendation
models, along with providing a comprehensive summary of the state-of-the-art. Finally, we expand on current
 trends and provide new perspectives pertaining to this new exciting development of the field.\",\"containe

tation-style-language/schema/raw/master/csl-citation.json\"} Let’s talk a little bit about how the recommen
dation system actually works. The conventional way is that the users data the data which is for example use
rs likes, user comments, users favourite things, users preferred bought items ACC. These data has to be tak
en to a central server where the server processes this data and recommends the user based upon the data tha
t the user generates. The user generates a lot of data depending upon the time and interaction. Even though
 from user standpoint it is just a simple like or it is just a simple comment which does not do anything to
 the user but it is a very useful data to the platform that the user is interacting with. So this all data
has to be taken to central server in order to recommend more things and more content and more items to the
user. This is how most of the company’s work and most of the platforms work. If we name, if we start to nam
e, let’s say Facebook or Instagram, they all collect data and take them to their central servers, which are
 far away from the place where user is using it or at least far away from the users own device. Tender cent
ral servers or central platforms, they process this data, they process all this users likes and comments an
d shares etc, and they applied algorithm to the data to generate more recommendations that is then brought
back to the users device. The user then sees his recommendations and most likely interacts with the recomme
ndations. So for example in the frequently bought items of Amazon user may buy one of the recommended items
 and the and the bought item is another data which then goes to Amazon central servers and then it adds to
the already users data that is present in the central server and the algorithm adapts to the new data that
has come and the cycle goes on. The new data then generates a new recommendation content and the cycle goes
 on and the recommendation improves centrally. (Chajewska et al., 2013; H.-T. Cheng et al., 2016; Halko et

integer quantum Hall state can support Majorana zero modes at domain walls between its two different stable
 chiral edge phases without superconductivity. This is due to the existence of an edge phase that does not
support gapless fermionic excitations; all gapless excitations are bosonic in this edge phase. Majorana fer
mion zero modes occur at a domain wall between this edge phase and the more conventional one that does supp
ort gapless fermions. Remarkably, due to the chirality of the system, the topological degeneracy of these z
ero modes has exponential protection, as a function of the relevant length scales, in spite of the presence
 of gapless excitations, including gapless fermions. These results are compatible with charge conservation,
 but do not require it. We discuss generalizations to other integer and fractional quantum Hall states, and
 classify possible mechanisms for appearance of Majorana zero modes at domain walls.\",\"container-title\":

integer quantum Hall state can support Majorana zero modes at domain walls between its two different stable
 chiral edge phases without superconductivity. This is due to the existence of an edge phase that does not
support gapless fermionic excitations; all gapless excitations are bosonic in this edge phase. Majorana fer
mion zero modes occur at a domain wall between this edge phase and the more conventional one that does supp
ort gapless fermions. Remarkably, due to the chirality of the system, the topological degeneracy of these z
ero modes has exponential protection, as a function of the relevant length scales, in spite of the presence
 of gapless excitations, including gapless fermions. These results are compatible with charge conservation,
 but do not require it. We discuss generalizations to other integer and fractional quantum Hall states, and
 classify possible mechanisms for appearance of Majorana zero modes at domain walls.\",\"container-title\":

bing the scaling limit of the Potts quantum spin chain using a combination of two approaches. The first is
the renormalized truncated conformal space approach (TCSA), while the second one is a new thermodynamic Bet
he Ansatz (TBA) system for the excited state spectrum in finite volume. For the TCSA we investigate and cla
rify several aspects of the renormalization procedure and counter term construction. The TBA system is firs
t verified by comparing its ultraviolet limit to conformal field theory and the infrared limit to exact S-m
atrix predictions. We then show that the TBA and the renormalized TCSA match each other to a very high prec
ision for a large range of the volume parameter, providing both a further verification of the TBA system an
d a demonstration of the efficiency of the TCSA renormalization procedure. We also discuss the lessons lear
ned from our results concerning recent developments regarding the low-energy scattering of quasi-particles
in the quantum Potts spin chain.\",\"container-title\":\"Journal of High Energy Physics\",\"DOI\":\"10.1007

.com/citation-style-language/schema/raw/master/csl-citation.json\"} One hack to the central server and the
complete database is vulnerable to the hacker. Once that happens imagine the financial fraud imagine the le
gal fraud that can be done because of this data breach and the vulnerability of the central server. Also it
 is not just about the ill-intentional use of the data once the central server is hacked. Let us suppose th
at the central server is not hacked and the company is using the data as they intend, however the way they
are using the data may not be favourable to the users and may be ethically wrong when it comes to users poi
nt of view. There can also be behavioural manipulation because of the central server data that is collected
 at one place. For example if the central server knows from reading the data that the user is depressed at
a certain period of time in a day the central server can recommend the user things like junk food or maybe
items of suicide or items that can be used as suicide etc. So the fact is that they are not just recommendi
ng or showing the user content or items they are basically nudging the users behaviour toward a certain con
sequence which is not right. (Cano et al., 2015b; Charbonneau et al., 2019; Datta et al., 2015a; Goodfellow

We present AdFisher, an automated tool that explores how user behaviors, Google\u0027s ads, and Ad Settings interact. AdFisher can run browser-based experiments and analyze data using machine learning and significance tests. Our tool uses a rigorous experimental design and statistical analysis to ensure the statistical soundness of our results. We use AdFisher to find that the Ad Settings was opaque about some features of a user\u0027s profile, that it does provide some choice on ads, and that these choices can lead to seemingly discriminatory ads. In particular, we found that visiting webpages associated with substance abuse changed the ads shown but not the settings page. We also found that setting the gender to female resulted in getting fewer instances of an ad related to high paying jobs than setting it to male. We cannot determine who caused these findings due to our limited visibility into the ad ecosystem, which includes Google, advertisers, websites, and users. Nevertheless, these results can form the starting point for deeper investigations by either the companies themselves or by regulatory bodies.\",\"DOI\":\"10.48550/arXiv.1408.6491\",\"note\":\"arXiv:1408.6491 [cs]\",\"number\":\"arXiv:1408.6491\",\"publisher\":\"arXiv\",\"source\":\"arXiv.org\",\"title\":\"Automated Experiments on Ad Privacy Settings: A Tale of Opacity, Choice, and Discrimination\",\"title-short\":\"Automated Experiments on Ad Privacy Settings\",\"URL\":\"http://arxiv.org/abs/1408.6491\",\"author\":[{\"family\":\"Datta\",\"given\":\"Amit\"},{\"family\":\"Tschantz\",\"given\":\"Michael Carl\"},{\"family\":\"Datta\",\"given\":\"Anupam\"}],\"accessed\":{\"date-parts\":[[\"2026\",2,16]]},\"issued\":{\"date-parts\":[[\"2015\",3,17]]}}},{\"id\":188,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/BAGGHN8S\"],\"itemData\":{\"id\":188,\"type\":\"article\",\"abstract\":\"Several machine learning models, including neural networks, consistently misclassify adversarial examples---inputs formed by applying small but intentionally worst-case perturbations to examples from the dataset, such that the perturbed input results in the model outputting an incorrect answer with high confidence. Early attempts at explaining this phenomenon focused on nonlinearity and overfitting. We argue instead that the primary cause of neural networks\u0027 vulnerability to adversarial perturbation is their linear nature. This explanation is supported by new quantitative results while giving the first explanation of the most intriguing fact about them: their generalization across architectures and training sets. .com/citation-style-language/schema/raw/master/csl-citation.json\"} One hack to the central server and the

```
complete database is vulnerable to the hacker. Once that happens imagine the financial fraud imagine the le
gal fraud that can be done because of this data breach and the vulnerability of the central server. Also it
 is not just about the ill-intentional use of the data once the central server is hacked. Let us suppose th
at the central server is not hacked and the company is using the data as they intend, however the way they
are using the data may not be favourable to the users and may be ethically wrong when it comes to users poi
nt of view. There can also be behavioural manipulation because of the central server data that is collected
 at one place. For example if the central server knows from reading the data that the user is depressed at
a certain period of time in a day the central server can recommend the user things like junk food or maybe
items of suicide or items that can be used as suicide etc. So the fact is that they are not just recommendi
ng or showing the user content or items they are basically nudging the users behaviour toward a certain con
sequence which is not right. (Cano et al., 2015b; Charbonneau et al., 2019; Datta et al., 2015a; Goodfellow

integer quantum Hall state can support Majorana zero modes at domain walls between its two different stable
 chiral edge phases without superconductivity. This is due to the existence of an edge phase that does not
support gapless fermionic excitations; all gapless excitations are bosonic in this edge phase. Majorana fer
mion zero modes occur at a domain wall between this edge phase and the more conventional one that does supp
ort gapless fermions. Remarkably, due to the chirality of the system, the topological degeneracy of these z
ero modes has exponential protection, as a function of the relevant length scales, in spite of the presence
 of gapless excitations, including gapless fermions. These results are compatible with charge conservation,
 but do not require it. We discuss generalizations to other integer and fractional quantum Hall states, and
 classify possible mechanisms for appearance of Majorana zero modes at domain walls.\",\"container-title\":

ticle\",\"abstract\":\"To partly address people\u0027s concerns over web tracking, Google has created the A
d Settings webpage to provide information about and some choice over the profiles Google creates on users.
We present AdFisher, an automated tool that explores how user behaviors, Google\u0027s ads, and Ad Settings
 interact. AdFisher can run browser-based experiments and analyze data using machine learning and significa
nce tests. Our tool uses a rigorous experimental design and statistical analysis to ensure the statistical
soundness of our results. We use AdFisher to find that the Ad Settings was opaque about some features of a
user\u0027s profile, that it does provide some choice on ads, and that these choices can lead to seemingly
discriminatory ads. In particular, we found that visiting webpages associated with substance abuse changed
the ads shown but not the settings page. We also found that setting the gender to female resulted in gettin
g fewer instances of an ad related to high paying jobs than setting it to male. We cannot determine who cau
sed these findings due to our limited visibility into the ad ecosystem, which includes Google, advertisers,
 websites, and users. Nevertheless, these results can form the starting point for deeper investigations by
either the companies themselves or by regulatory bodies.\",\"DOI\":\"10.48550/arXiv.1408.6491\",\"note\":\"

ticle\",\"abstract\":\"To partly address people\u0027s concerns over web tracking, Google has created the A
d Settings webpage to provide information about and some choice over the profiles Google creates on users.
We present AdFisher, an automated tool that explores how user behaviors, Google\u0027s ads, and Ad Settings
 interact. AdFisher can run browser-based experiments and analyze data using machine learning and significa
nce tests. Our tool uses a rigorous experimental design and statistical analysis to ensure the statistical
soundness of our results. We use AdFisher to find that the Ad Settings was opaque about some features of a
user\u0027s profile, that it does provide some choice on ads, and that these choices can lead to seemingly
discriminatory ads. In particular, we found that visiting webpages associated with substance abuse changed
the ads shown but not the settings page. We also found that setting the gender to female resulted in gettin
g fewer instances of an ad related to high paying jobs than setting it to male. We cannot determine who cau
sed these findings due to our limited visibility into the ad ecosystem, which includes Google, advertisers,
 websites, and users. Nevertheless, these results can form the starting point for deeper investigations by
either the companies themselves or by regulatory bodies.\",\"DOI\":\"10.48550/arXiv.1408.6491\",\"note\":\"

Early attempts at explaining this phenomenon focused on nonlinearity and overfitting. We argue instead that the primary cause of neural networks\u0027 vulnerability to adversarial perturbation is their linear nature. This explanation is supported by new quantitative results while giving the first explanation of the most intriguing fact about them: their generalization across architectures and training sets. Moreover, this view yields a simple and fast method of generating adversarial examples. Using this approach to provide examples for adversarial training, we reduce the test set error of a maxout network on the MNIST dataset.\",\"DOI\":\"10.48550/arXiv.1412.6572\",\"note\":\"arXiv:1412.6572 [stat]\",\"number\":\"arXiv:1412.6572\",\"publisher\":\"arXiv\",\"source\":\"arXiv.org\",\"title\":\"Explaining and Harnessing Adversarial Examples\",\"URL\":\"http://arxiv.org/abs/1412.6572\",\"author\":[{\"family\":\"Goodfellow\",\"given\":\"Ian J.\"},{\"family\":\"Shlens\",\"given\":\"Jonathon\"},{\"family\":\"Szegedy\",\"given\":\"Christian\"}],\"accessed\":{\"date-parts\":[[\"2026\",2,16]]},\"issued\":{\"date-parts\":[[\"2015\",3,20]]}}},{\"id\":202,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/HYUINALC\"],\"itemData\":{\"id\":202,\"type\":\"article\",\"abstract\":\"Federated learning (FL) is a machine learning setting where many clients (e.g. mobile devices or whole organizations) collaboratively train a model under the orchestration of a central server (e.g. service provider), while keeping the training data decentralized. Our techniques are robust to perturbation in the data and tolerate some mistakes in the adversary\u0027s background knowledge. We apply our de-anonymization methodology to the Netflix Prize dataset, which contains anonymous movie ratings of 500,000 subscribers of Netflix, the world\u0027s largest online movie rental service. We demonstrate that an adversary who knows only a little bit about an individual subscriber can easily identify this subscriber\u0027s record in the dataset. Using the Internet Movie Database as the source of background knowledge, we successfully identified the Netflix records of known users, uncovering their apparent political preferences and other potentially sensitive information.\",\"DOI\":\"10.48550/arXiv.cs/0610105\",\"note\":\"arXiv:cs/0610105\",\"number\":\"arXiv:cs/0610105\",\"publisher\":\"arXiv\",\"source\":\"arXiv.org\",\"title\":\"How To Break Anonymity of the Netflix Prize Dataset\",\"URL\":\"http://arxiv.org/abs/cs/0610105\",\"author\":[{\"family\":\"Narayanan\",\"given\":\"Arvind\"},{\"family\":\"Shmatikov\",\"given\":\"Vitaly\"}],\"accessed\":{\"date-parts\":[[\"2026\",2,16]]},\"issued\":{\"date-parts\":[[\"2007\",11,22]]}}},{\"id\":184,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/TZANIIT3\"],\"itemData\":{\"id\":184,\"type\":\"article\",\"abstract\":\"We quantitatively investigate how machine learning models leak information about the individual data records on which they were trained. We focus on the basic membership inference attack: given a data record and black-box access to a model, determine if the record was in the mode

l\u0027s training dataset. To perform membership inference against a target model, we make adversarial use of machine learning and train our own inference model to recognize differences in the target model\u0027s predictions on the inputs that it trained on versus the inputs that it did not train on. We empirically evaluate our inference techniques on classification models trained by commercial \\\"machine learning as a service\\\" providers such as Google and Amazon. Using realistic datasets and classification tasks, including a hospital discharge dataset whose membership is sensitive from the privacy perspective, we show that these models can be vulnerable to membership inference attacks. We then investigate the factors that influence this leakage and evaluate mitigation strategies.\",\"DOI\":\"10.48550/arXiv.1610.05820\",\"note\":\"arXiv:1610.05820 [cs]\",\"number\":\"arXiv:1610.05820\",\"publisher\":\"arXiv\",\"source\":\"arXiv.org\",\"title\":\"Membership Inference Attacks against Machine Learning Models\",\"URL\":\"http://arxiv.org/abs/1610.05820\",\"author\":[{\"family\":\"Shokri\",\"given\":\"Reza\"},{\"family\":\"Stronati\",\"given\":\"Marco\"},{\"family\":\"Song\",\"given\":\"Congzheng\"},{\"family\":\"Shmatikov\",\"given\":\"Vitaly\"}],\"accessed\":{\"date-parts\":[[\"2026\",2,16]]},\"issued\":{\"date-parts\":[[\"2017\",3,31]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} One hack to the central server and the complete database is vulnerable to the hacker. Once that happens imagine the financial fraud imagine the legal fraud that can be done because of this data breach and the vulnerability of the central server. Also it is not just about the ill-intentional use of the data once the central server is hacked. Let us suppose that the central server is not hacked and the company is using the data as they intend, however the way they are using the data may not be favourable to the users and may be ethically wrong when it comes to users point of view. There can also be behavioural manipulation because of the central server data that is collected at one place. For example if the central server knows from reading the data that the user is depressed at a certain period of time in a day the central server can recommend the user things like junk food or maybe items of suicide or items that can be used as suicide etc. So the fact is that they are not just recommending or showing the user content or items they are basically nudging the users behaviour toward a certain consequence which is not right. d\":233,\"type\":\"article\",\"abstract\":\"Modern mobile devices have access to a wealth of data suitable
for learning models, which in turn can greatly improve the user experience on the device. For example, lang
uage models can improve speech recognition and text entry, and image models can automatically select good p
hotos. However, this rich data is often privacy sensitive, large in quantity, or both, which may preclude l
ogging to the data center and training there using conventional approaches. We advocate an alternative that
 leaves the training data distributed on the mobile devices, and learns a shared model by aggregating local
ly-computed updates. We term this decentralized approach Federated Learning. We present a practical method
for the federated learning of deep networks based on iterative model averaging, and conduct an extensive em
pirical evaluation, considering five different model architectures and four datasets. These experiments dem
onstrate the approach is robust to the unbalanced and non-IID data distributions that are a defining charac
teristic of this setting. Communication costs are the principal constraint, and we show a reduction in requ
ired communication rounds by 10-100x as compared to synchronized stochastic gradient descent.\",\"DOI\":\"1

}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} In this
document we present a solution that is called Federated learning. Federated learning is a distributed learn
ing system in which the data instead of going to a central server is trained on the device of the user itse
lf. One primary thing that is solved because of the federated learning is that the data does not leave the
device of the users that way user can have their privacy as much as possible. This consequently makes compa
ny blind to what the user likes what the user comments and their history their watch history their buying h
istory etc and consequently the companies cannot behaviourally manipulate the user or misuse their data or
sell their data to hackers for ill intentions. The whole idea of Federated learning is that the machine lea
rning which happens at the central server is now happening in the device of the user itself. But since we k
now that the user’s device is not as powerful and strong as the central server are so there has to be some
compensation. However, the good thing is that the compensation is not in the privacy, no privacy is jeopard
ised. The compensation lies in the model training and the model that the central server receives. This whol
e document talks about the federated learning in a very deep detail. (Kairouz et al., 2021d; McMahan et al.

}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} In this
document we present a solution that is called Federated learning. Federated learning is a distributed learn
ing system in which the data instead of going to a central server is trained on the device of the user itse
lf. One primary thing that is solved because of the federated learning is that the data does not leave the
device of the users that way user can have their privacy as much as possible. This consequently makes compa
ny blind to what the user likes what the user comments and their history their watch history their buying h
istory etc and consequently the companies cannot behaviourally manipulate the user or misuse their data or
sell their data to hackers for ill intentions. The whole idea of Federated learning is that the machine lea
rning which happens at the central server is now happening in the device of the user itself. But since we k
now that the user’s device is not as powerful and strong as the central server are so there has to be some
compensation. However, the good thing is that the compensation is not in the privacy, no privacy is jeopard
ised. The compensation lies in the model training and the model that the central server receives. This whol
e document talks about the federated learning in a very deep detail. (Kairouz et al., 2021d; McMahan et al.

"Machine learning techniques based on neural networks are achieving remarkable results in a wide variety of
 domains. Often, the training of models requires large, representative datasets, which may be crowdsourced
and contain sensitive information. The models should not expose private information in these datasets. Addr
essing this goal, we develop new algorithmic techniques for learning and a refined analysis of privacy cost
s within the framework of differential privacy. Our implementation and experiments demonstrate that we can
train deep neural networks with non-convex objectives, under a modest privacy budget, and at a manageable c
ost in software complexity, training efficiency, and model quality.\",\"container-title\":\"Proceedings of

ted learning is a recent advance in privacy protection. In this context, a trusted curator aggregates param
eters optimized in decentralized fashion by multiple clients. The resulting model is then distributed back
to all clients, ultimately converging to a joint representative model without explicitly having to share th
e data. However, the protocol is vulnerable to differential attacks, which could originate from any party c
ontributing during federated optimization. In such an attack, a client\u0027s contribution during training
and information about their data set is revealed through analyzing the distributed model. We tackle this pr
oblem and propose an algorithm for client sided differential privacy preserving federated optimization. The
 aim is to hide clients\u0027 contributions during training, balancing the trade-off between privacy loss a
nd model performance. Empirical studies suggest that given a sufficiently large number of participating cli
ents, our proposed procedure can maintain client-level differential privacy at only a minor cost in model p
erformance.\",\"DOI\":\"10.48550/arXiv.1712.07557\",\"note\":\"arXiv:1712.07557 [cs]\",\"number\":\"arXiv:1

```
abstract\":\"Federated learning enables resource-constrained edge compute devices, such as mobile phones an
d IoT devices, to learn a shared model for prediction, while keeping the training data local. This decentra
lized approach to train models provides privacy, security, regulatory and economic benefits. In this work,
we focus on the statistical challenge of federated learning when local data is non-IID. We first show that
the accuracy of federated learning reduces significantly, by up to 55% for neural networks trained for high
ly skewed non-IID data, where each client device trains only on a single class of data. We further show tha
t this accuracy reduction can be explained by the weight divergence, which can be quantified by the earth m
over\u0027s distance (EMD) between the distribution over classes on each device and the population distribu
tion. As a solution, we propose a strategy to improve training on non-IID data by creating a small subset o
f data which is globally shared between all the edge devices. Experiments show that accuracy can be increas
ed by 30% for the CIFAR-10 dataset with only 5% globally shared data.\",\"DOI\":\"10.48550/arXiv.1806.00582
\",\"note\":\"arXiv:1806.00582 [cs]\",\"source\":\"arXiv.org\",\"title\":\"Federated Learning with Non-IID
Data\",\"URL\":\"http://arxiv.org/abs/1806.00582\",\"author\":[{\"family\":\"Zhao\",\"given\":\"Yue\"},{\"f

s://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} However, there is no free lun
ch. The Federated Learning System also comes with a compensation. This compensation comes as the accuracy l
evel of the models and the recommendation system as compared to the centralised learning systems. In other
words, the centralised recommendation systems because they intake raw data from the devices have greater ac
curacy as compared to the Federated Learning Systems because the federated learning system do not give out
raw data to the centralised server and hence centralised server does not know the use and patterns of each
user individually. Hence the Federated learning system only averages the aggregated results of models recei
ved from individual devices and not the raw data itself. Had they received the raw data themselves the accu
racy would be greater but they do not. But on the other hand, the privacy is maintained. This paper tries t
o establish a sweet spot between accuracy and privacy of Federated learning system in mobile phones (refer
to Figure 1). Since as we discussed that there is no free lunch so obviously there is a trade-off between a
ccuracy and privacy when it comes to Federated learning system. So, we have to find a sweet spot where both
 accuracy and privacy work the best and work in the most optimal way possible. This does not mean that the
accuracy will match the accuracy of a centralised learning system or the privacy level will be the maximum
this is impossible. Our goal is to find the optimal point where both accuracy and privacy are at their best
 when it comes to Federated learning system and we are not concerned with comparing the accuracy and privac
y with centralised learning system because obviously centralised learning system have far greater accuracy
but far lesser privacy so we are not comparing that here. We’re only trying to find the optimal point where
 Federated learning will work best in terms of both accuracy and privacy. (Abadi et al., 2016a; Geyer et al

"Machine learning techniques based on neural networks are achieving remarkable results in a wide variety of
 domains. Often, the training of models requires large, representative datasets, which may be crowdsourced
and contain sensitive information. The models should not expose private information in these datasets. Addr
essing this goal, we develop new algorithmic techniques for learning and a refined analysis of privacy cost
s within the framework of differential privacy. Our implementation and experiments demonstrate that we can
train deep neural networks with non-convex objectives, under a modest privacy budget, and at a manageable c
ost in software complexity, training efficiency, and model quality.\",\"container-title\":\"Proceedings of

abstract\":\"Federated learning enables resource-constrained edge compute devices, such as mobile phones an
d IoT devices, to learn a shared model for prediction, while keeping the training data local. This decentra
lized approach to train models provides privacy, security, regulatory and economic benefits. In this work,
we focus on the statistical challenge of federated learning when local data is non-IID. We first show that
the accuracy of federated learning reduces significantly, by up to 55% for neural networks trained for high
ly skewed non-IID data, where each client device trains only on a single class of data. We further show tha
t this accuracy reduction can be explained by the weight divergence, which can be quantified by the earth m
over\u0027s distance (EMD) between the distribution over classes on each device and the population distribu
tion. As a solution, we propose a strategy to improve training on non-IID data by creating a small subset o
f data which is globally shared between all the edge devices. Experiments show that accuracy can be increas
ed by 30% for the CIFAR-10 dataset with only 5% globally shared data.\",\"DOI\":\"10.48550/arXiv.1806.00582

ch. The Federated Learning System also comes with a compensation. This compensation comes as the accuracy l
evel of the models and the recommendation system as compared to the centralised learning systems. In other
words, the centralised recommendation systems because they intake raw data from the devices have greater ac
curacy as compared to the Federated Learning Systems because the federated learning system do not give out
raw data to the centralised server and hence centralised server does not know the use and patterns of each
user individually. Hence the Federated learning system only averages the aggregated results of models recei
ved from individual devices and not the raw data itself. Had they received the raw data themselves the accu
racy would be greater but they do not. But on the other hand, the privacy is maintained. This paper tries t
o establish a sweet spot between accuracy and privacy of Federated learning system in mobile phones (refer
to Figure 1). Since as we discussed that there is no free lunch so obviously there is a trade-off between a
ccuracy and privacy when it comes to Federated learning system. So, we have to find a sweet spot where both
 accuracy and privacy work the best and work in the most optimal way possible. This does not mean that the
accuracy will match the accuracy of a centralised learning system or the privacy level will be the maximum
this is impossible. Our goal is to find the optimal point where both accuracy and privacy are at their best
 when it comes to Federated learning system and we are not concerned with comparing the accuracy and privac
y with centralised learning system because obviously centralised learning system have far greater accuracy
but far lesser privacy so we are not comparing that here. We’re only trying to find the optimal point where
 Federated learning will work best in terms of both accuracy and privacy. (Abadi et al., 2016a; Geyer et al

stract\":\"Modern mobile devices have access to a wealth of data suitable for learning models, which in tur
n can greatly improve the user experience on the device. For example, language models can improve speech re
cognition and text entry, and image models can automatically select good photos. However, this rich data is
 often privacy sensitive, large in quantity, or both, which may preclude logging to the data center and tra
ining there using conventional approaches. We advocate an alternative that leaves the training data distrib
uted on the mobile devices, and learns a shared model by aggregating locally-computed updates. We term this
 decentralized approach Federated Learning. We present a practical method for the federated learning of dee
p networks based on iterative model averaging, and conduct an extensive empirical evaluation, considering f
ive different model architectures and four datasets. These experiments demonstrate the approach is robust t
o the unbalanced and non-IID data distributions that are a defining characteristic of this setting. Communi
cation costs are the principal constraint, and we show a reduction in required communication rounds by 10-1
00x as compared to synchronized stochastic gradient descent.\",\"DOI\":\"10.48550/arXiv.1602.05629\",\"note

Training in heterogeneous and potentially massive networks introduces novel challenges that require a fundamental departure from standard approaches for large-scale machine learning, distributed optimization, and privacy-preserving data analysis. In this article, we discuss the unique characteristics and challenges of federated learning, provide a broad overview of current approaches, and outline several directions of future work that are relevant to a wide range of research communities.\",\"container-title\":\"IEEE Signal Processing Magazine\",\"DOI\":\"10.1109/MSP.2020.2975749\",\"ISSN\":\"1053-5888, 1558-0792\",\"issue\":\"3\",\"journalAbbreviation\":\"IEEE Signal Process. For example, language models can improve speech recognition and text entry, and image models can automatically select good photos. However, this rich data is often privacy sensitive, large in quantity, or both, which may preclude logging to the data center and training there using conventional approaches. We advocate an alternative that leaves the training data distributed on the mobile devices, and learns a shared model by aggregating locally-computed updates. We term this decentralized approach Federated Learning. We present a practical method for the federated learning of deep networks based on iterative model averaging, and conduct an extensive empirical evaluation, considering five different model architectures and four datasets. These experiments demonstrate the approach is robust to the unbalanced and non-IID data distributions that are a defining characteristic of this setting. Communication costs are the principal constraint, and we show a reduction in required communication rounds by 10-100x as compared to synchronized stochastic gradient descent.\",\"DOI\":\"10.48550/arXiv.1602.05629\",\"note\":\"arXiv:1602.05629 [cs]\",\"number\":\"arXiv:1602.05629\",\"publisher\":\"arXiv\",\"source\":\"arXiv.org\",\"title\":\"Communication-Efficient Learning of Deep Networks from Decentralized Data\",\"URL\":\"http://arxiv.org/abs/1602.05629\",\"author\":[{\"family\":\"McMahan\",\"given\":\"H. This decentralized approach to train models provides privacy, security, regulatory and economic benefits. In this work, we focus on the statistical challenge of federated learning when local data is non-IID. We first show that the accuracy of federated learning reduces significantly, by up to 55% for neural networks trained for highly skewed non-IID data, where each client device trains only on a single class of data. We further show that this accuracy reduction can be explained by the weight divergence, which can be quantified by the earth mover\u0027s distance (EMD) between the distribution over classes on each device and the population distribution. As a solution, we propose a strategy to improve training on non-IID data by creating a small subset of data which is globally shared between all the edge devices. Experiments show that accuracy can be increased by 30% for the CIFAR-10 dataset with only 5% globally shared data.\",\"DOI\":\"10.48550/arXiv.1806.00582\",\"note\":\"arXiv:1806.00582 [cs]\",\"source\":\"arXiv.org\",\"title\":\"Federated Learning with Non-IID

Data\",\"URL\":\"http://arxiv.org/abs/1806.00582\",\"author\":[{\"family\":\"Zhao\",\"given\":\"Yue\"},{\"family\":\"Li\",\"given\":\"Meng\"},{\"family\":\"Lai\",\"given\":\"Liangzhen\"},{\"family\":\"Suda\",\"given\":\"Naveen\"},{\"family\":\"Civin\",\"given\":\"Damon\"},{\"family\":\"Chandra\",\"given\":\"Vikas\"}],\"accessed\":{\"date-parts\":[[\"2026\",2,16]]},\"issued\":{\"date-parts\":[[\"2018\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} However, there is no free lunch. The Federated Learning System also comes with a compensation. This compensation comes as the accuracy level of the models and the recommendation system as compared to the centralised learning systems. In other words, the centralised recommendation systems because they intake raw data from the devices have greater accuracy as compared to the Federated Learning Sysems because the federated learning system do not give out raw data to the centralised server and hence centralised server does not know the use and patterns of each user individually. Hence the Federated learning system only averages the aggregated results of models received from individual devices and not the raw data itself. Had they received the raw data themselves the accuracy would be greater but they do not. But on the other hand, the privacy is maintained. This paper tries to establish a sweet spot between accuracy and privacy of Federated learning system in mobile phones (refer to Figure 1). Since as we discussed that there is no free lunch so obviously there is a trade-off between accuracy and privacy when it comes to Federated learning system. So, we have to find a sweet spot where both accuracy and privacy work the best and work in the most optimal way possible. This does not mean that the accuracy will match the accuracy of a centralised learning system or the privacy level will be the maximum this is impossible. Our goal is to find the optimal point where both accuracy and privacy are at their best when it comes to Federated learning system and we are not concerned with comparing the accuracy and privacy with centralised learning system because obviously centralised learning system have far greater accuracy but far lesser privacy so we are not comparing that here. We’re only trying to find the optimal point where Federated learning will work best in terms of both accuracy and privacy. (Abadi et al., 2016a; Geyer et al., 2018a; Kairouz et al., 2021f; T. Li, Sahu, et al., 2020; McMahan et al., 2023c; Y. Zhao et al., 2018)",

However, this approach poses privacy concerns. Especially with popular cloud services, the control over the privacy of the sensitive data is lost. Even when the keys are not shared, the encrypted material is shared with a third party that does not necessarily need to access the content. Moreover, untrusted servers, providers, and cloud operators can keep identifying elements of users long after users end the relationship with the services. Indeed, Homomorphic Encryption (HE), a special kind of encryption scheme, can address these concerns as it allows any third party to operate on the encrypted data without decrypting it in advance. Although this extremely useful feature of the HE scheme has been known for over 30 years, the first plausible and achievable Fully Homomorphic Encryption (FHE) scheme, which allows any computable function to perform on the encrypted data, was introduced by Craig Gentry in 2009. Even though this was a major achievement, different implementations so far demonstrated that FHE still needs to be improved significantly to be practical on every platform. First, we present the basics of HE and the details of the well-known Partially Homomorphic Encryption (PHE) and Somewhat Homomorphic Encryption (SWHE), which are important pillars of achieving FHE. Then, the main FHE families, which have become the base for the other follow-up FHE schemes are presented. Furthermore, the implementations and recent improvements in Gentry-type FHE schemes are also surveyed. Finally, further research directions are discussed. This survey is intended to give a clear knowledge and foundation to researchers and practitioners interested in knowing, applying, as well as extending the state of

end on sharing a key (public or private) among the peers involved in exchanging an encrypted message. Howev
er, this approach poses privacy concerns. Especially with popular cloud services, the control over the priv
acy of the sensitive data is lost. Even when the keys are not shared, the encrypted material is shared with
 a third party that does not necessarily need to access the content. Moreover, untrusted servers, providers
, and cloud operators can keep identifying elements of users long after users end the relationship with the
 services. Indeed, Homomorphic Encryption (HE), a special kind of encryption scheme, can address these conc
erns as it allows any third party to operate on the encrypted data without decrypting it in advance. Althou
gh this extremely useful feature of the HE scheme has been known for over 30 years, the first plausible and
 achievable Fully Homomorphic Encryption (FHE) scheme, which allows any computable function to perform on t
he encrypted data, was introduced by Craig Gentry in 2009. Even though this was a major achievement, differ
ent implementations so far demonstrated that FHE still needs to be improved significantly to be practical o

g is to collaboratively train a neural network on a server. Each user receives the current weights of the n
etwork and in turns sends parameter updates (gradients) based on local data. This protocol has been designe
d not only to train neural networks data-efficiently, but also to provide privacy benefits for users, as th
eir input data remains on device and only parameter gradients are shared. But how secure is sharing paramet
er gradients? Previous attacks have provided a false sense of security, by succeeding only in contrived set
tings - even for a single image. However, by exploiting a magnitude-invariant loss along with optimization
strategies based on adversarial attacks, we show that is is actually possible to faithfully reconstruct ima
ges at high resolution from the knowledge of their parameter gradients, and demonstrate that such a break o
f privacy is possible even for trained deep networks. We analyze the effects of architecture as well as par
ameters on the difficulty of reconstructing an input image and prove that any input to a fully connected la
yer can be reconstructed analytically independent of the remaining architecture. Finally we discuss setting
s encountered in practice and show that even averaging gradients over several iterations or several images
does not protect the user\u0027s privacy in federated learning applications in computer vision.\",\"DOI\":\

In simple word if enough gradients are observed by the attacker, the attacker can reverse engineer the whole process and reach the initial data which created all these lists of gradients. To explain the vulnerability the relationship between the data and the gradient , points in the direction that minimizes loss for the specific data point . This gradient carries fingerprint of the datapoint . In other words, if there are enough gradient, then all the gradient can be reverse engineer to find the original data point. So this is a serious vulnerability. This technique is called deep leakage. (Abadi et al., 2016c; Geiping et al., 2020a; Geyer et al., 2018b; Goodfellow et al., 2015b; Shokri et al., 2017c; B. In simple word if enough gradients are observed by the attacker, the attacker can reverse engineer the whol
e process and reach the initial data which created all these lists of gradients. To explain the vulnerabili
ty the relationship between the data and the gradient , points in the direction that minimizes loss for the
 specific data point . This gradient carries fingerprint of the datapoint . In other words, if there are en
ough gradient, then all the gradient can be reverse engineer to find the original data point. So this is a
serious vulnerability. This technique is called deep leakage. (Abadi et al., 2016c; Geiping et al., 2020a;

on sharing a key (public or private) among the peers involved in exchanging an encrypted message. However,
this approach poses privacy concerns. Especially with popular cloud services, the control over the privacy
of the sensitive data is lost. Even when the keys are not shared, the encrypted material is shared with a t
hird party that does not necessarily need to access the content. Moreover, untrusted servers, providers, an
d cloud operators can keep identifying elements of users long after users end the relationship with the ser
vices. Indeed, Homomorphic Encryption (HE), a special kind of encryption scheme, can address these concerns
 as it allows any third party to operate on the encrypted data without decrypting it in advance. Although t
his extremely useful feature of the HE scheme has been known for over 30 years, the first plausible and ach
ievable Fully Homomorphic Encryption (FHE) scheme, which allows any computable function to perform on the e
ncrypted data, was introduced by Craig Gentry in 2009. Even though this was a major achievement, different
implementations so far demonstrated that FHE still needs to be improved significantly to be practical on ev
ery platform. First, we present the basics of HE and the details of the well-known Partially Homomorphic En
cryption (PHE) and Somewhat Homomorphic Encryption (SWHE), which are important pillars of achieving FHE. Th
en, the main FHE families, which have become the base for the other follow-up FHE schemes are presented. Fu
rthermore, the implementations and recent improvements in Gentry-type FHE schemes are also surveyed. Finall
y, further research directions are discussed. This survey is intended to give a clear knowledge and foundat
ion to researchers and practitioners interested in knowing, applying, as well as extending the state of the
 art HE, PHE, SWHE, and FHE systems.\",\"DOI\":\"10.48550/arXiv.1704.03578\",\"note\":\"arXiv:1704.03578 [c

on sharing a key (public or private) among the peers involved in exchanging an encrypted message. However,
this approach poses privacy concerns. Especially with popular cloud services, the control over the privacy
of the sensitive data is lost. Even when the keys are not shared, the encrypted material is shared with a t
hird party that does not necessarily need to access the content. Moreover, untrusted servers, providers, an
d cloud operators can keep identifying elements of users long after users end the relationship with the ser
vices. Indeed, Homomorphic Encryption (HE), a special kind of encryption scheme, can address these concerns
 as it allows any third party to operate on the encrypted data without decrypting it in advance. Although t
his extremely useful feature of the HE scheme has been known for over 30 years, the first plausible and ach
ievable Fully Homomorphic Encryption (FHE) scheme, which allows any computable function to perform on the e
ncrypted data, was introduced by Craig Gentry in 2009. Even though this was a major achievement, different
implementations so far demonstrated that FHE still needs to be improved significantly to be practical on ev
ery platform. First, we present the basics of HE and the details of the well-known Partially Homomorphic En
cryption (PHE) and Somewhat Homomorphic Encryption (SWHE), which are important pillars of achieving FHE. Th
en, the main FHE families, which have become the base for the other follow-up FHE schemes are presented. Fu
rthermore, the implementations and recent improvements in Gentry-type FHE schemes are also surveyed. Finall
y, further research directions are discussed. This survey is intended to give a clear knowledge and foundat
ion to researchers and practitioners interested in knowing, applying, as well as extending the state of the
 art HE, PHE, SWHE, and FHE systems.\",\"DOI\":\"10.48550/arXiv.1704.03578\",\"note\":\"arXiv:1704.03578 [c

ourced neural network inference presents significant privacy challenges, as sensitive user data is processe
d on untrusted remote servers. Secure inference offers a privacy-preserving solution, but existing framewor
ks suffer from high computational overhead and communication costs, rendering them impractical for real-wor
ld deployment. We introduce SecONNds, a non-intrusive secure inference framework optimized for large ImageN
et-scale Convolutional Neural Networks. SecONNds integrates a novel fully Boolean Goldreich-Micali-Wigderso
n (GMW) protocol for secure comparison -- addressing Yao\u0027s millionaires\u0027 problem -- using preproc
essed Beaver\u0027s bit triples generated from Silent Random Oblivious Transfer. Our novel protocol achieve
s an online speedup of 17$\\\\times$ in nonlinear operations compared to state-of-the-art solutions while r
educing communication overhead. To further enhance performance, SecONNds employs Number Theoretic Transform
 (NTT) preprocessing and leverages GPU acceleration for homomorphic encryption operations, resulting in spe
edups of 1.6$\\\\times$ on CPU and 2.2$\\\\times$ on GPU for linear operations. We also present SecONNds-P,
 a bit-exact variant that ensures verifiable full-precision results in secure computation, matching the res
```

```
ults of plaintext computations. Evaluated on a 37-bit quantized SqueezeNet model, SecONNds achieves an end-
to-end inference time of 2.8 s on GPU and 3.6 s on CPU, with a total communication of just 420 MiB. SecONNd
s\u0027 efficiency and reduced computational load make it well-suited for deploying privacy-sensitive appli
cations in resource-constrained environments. SecONNds is open source and can be accessed from: https://git
hub.com/shashankballa/SecONNds.\",\"DOI\":\"10.48550/arXiv.2506.11586\",\"note\":\"arXiv:2506.11586 [cs]\",

This has resulted in an increased demand for secure and private means of information computation. Towards this, the Yao\u0027s Millionaires\u0027 problem, i.e., to determine the richer among two millionaires\u0027 securely, finds an application. In this work, we present a new solution to the Yao\u0027s Millionaires\u0027 problem namely, Privacy Preserving Comparison (PPC). We show that PPC achieves this comparison in constant time as well as in one execution. PPC uses semi-honest third parties for the comparison who do not learn any information about the values. Further, we show that PPC is collusion-resistance. To demonstrate the significance of PPC, we present a secure, approximate single-minded combinatorial auction, which we call TPACAS, i.e., Truthful, Privacy-preserving Approximate Combinatorial Auction for Single-minded bidders. We show that TPACAS, unlike previous works, preserves the following privacies relevant to an auction: agent privacy, the identities of the losing bidders must not be revealed to any other agent except the auctioneer (AU), bid privacy, the bid values must be hidden from the other agents as well as the AU and bid-topology privacy, the items for which the agents are bidding must be hidden from the other agents as well as the AU. We demonstrate the practicality of TPACAS through simulations. Lastly, we also look at TPACAS\u0027 implementation over a publicly distributed ledger, such as the Ethereum blockchain.\",\"DOI\":\"10.48550/ARXIV.1906.06567\",\"license\":\"arXiv.org perpetual, non-exclusive license\",\"note\":\"version: 1\",\"publisher\":\"arXiv\",\"source\":\"DOI.org (Datacite)\",\"title\":\"A Practical Solution to Yao\u0027s Millionaires\u0027 Problem and Its Application in Designing Secure Combinatorial Auction\",\"URL\":\"https://arxiv.org/abs/1906.06567\",\"author\":[{\"family\":\"Damle\",\"given\":\"Sankarshan\"},{\"family\":\"Faltings\",\"given\":\"Boi\"},{\"family\":\"Gujar\",\"given\":\"Sujit\"}],\"accessed\":{\"date-parts\":[[\"2026\",2,16]]},\"issued\":{\"date-parts\":[[\"2019\"]]}},\"locator\":\"2\",\"label\":\"page\"},{\"id\":392,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/YJ5SBNLM\"],\"itemData\":{\"id\":392,\"type\":\"article\",\"abstract\":\"Increasing use of computers and networks in business, government, recreation, and almost all aspects of daily life has led to a proliferation of online sensitive data about individuals and organizations. Consequently, concern about the privacy of these data has become a top priority, particularly those data that are created and used in electronic commerce. There have been many formulations of privacy and, unfortunately, many negative results about the feasibility of maintaining privacy of sensitive data in realistic networked environments. We formulate communication-complexity-based definitions, both worst-case and average-case, of a problem\u0027s privacy-approximation ratio. We use our definitions to investigate the extent to which approximate privacy is achievable in two standard problems: the second-price Vickrey auction and the millionaires problem of Yao. For both the second-price Vickrey auction and the millionaires problem, we show that not only is perfect privacy impossible or infeasibly costly to achieve, but even close approximations of perfect privacy suffer from the same lower bounds. By contrast, we show that, if the values of the parties are drawn uniformly at random from {0,...,2^k-1}, then, for both problems, simple and natural communication protocols have privacy-approximation ratios that are linear in k (i.e., logarithmic in the size of the space of possible inputs). We conjecture that this improved privacy-approximation ratio is achievable for any probability distribution.\",\"DOI\":\"10.48550/ARXIV.0910.5714\",\"license\":\"arXiv.org perpetual, non-exclusive license\",\"note\":\"version: 2\",\"publisher\":\"arXiv\",\"source\":\"DOI.org (Datacite)\",\"title\":\"Approximate Privacy: Foundations and Quantification\",\"title-short\":\"Approximate Privacy\",\"URL\":\"https://arxiv.org/abs/0910.5714\",\"author\":[{\"family\":\"Feigenbaum\",\"given\":\"Joan\"},{\"family\":\"Jaggard\",\"given\":\"Aaron D.\"},{\"family\":\"Schapira\",\"given\":\"Michael\"}],\"accessed\":{\"date-parts\":[[\"2026\",2,16]]},\"issued\":{\"date-parts\":[[\"2009\"]]}},\"locator\":\"5\",\"label\":\"page\"},{\"id\":387,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/WEIC56R8\"],\"itemData\":{\"id\":387,\"type\":\"article-journal\",\"abstract\":\"Secure multiparty computations enable the distribution of so-called shares of sensitive data to multiple parties such that the multiple parties can effectively process the data while being unable to glean much information about the data (at least not without collusion among all parties to put back together all the shares). Thus, the parties may conspire to send all their processed results to a trusted third party (perhaps the data provider) at the conclusion of the computations, with only the trusted third party being able to view the final results. Secure multiparty computations for privacy-preserving machine-learning turn out to be possible using solely standard floating-point arithmetic, at least with a carefully controlled leakage of information less than the loss of accuracy due to roundoff, all backed by rigorous mathematical proofs of worst-case bounds on information loss and numerical stability in finite-precision arithmetic. Numerical examples illustrate the high performance attained on commodity off-the-shelf hardware for generalized linear models, including ordinary linear least-squares regression, binary and multinomial logistic regression, probit regression, and Poisson regression.\",\"DOI\":\"10.48550/ARXIV.2001.03192\",\"license\":\"arXiv.org perpetual, non-exclusive license\",\"note\":\"version: 1\",\"publisher\":\"arXiv\",\"source\":\"DOI.org (Datacite)\",\"title\":\"Secure multiparty computations in floating-point arithmetic\",\"URL\":\"https://arxiv.org/abs/2001.03192\",\"author\":[{\"family\":\"Guo\",\"given\":\"Chuan\"},{\"family\":\"Hannun\",\"given\":\"Awni\"},{\"family\":\"Knott\",\"given\":\"Brian\"},{\"family\":\"Maaten\",\"given\":\"Laurens\",\"non-dropping-particle\":\"van der\"},{\"family\":\"Tygert\",\"given\":\"Mark\"},{\"family\":\"Zhu\",\"given\":\"Ruiyu\"}],\"accessed\":{\"date-parts\":[[\"2026\",2,16]]},\"issued\":{\"date-parts\":[[\"2020\"]]}},\"locator\":\"1\",\"label\":\"page\"},{\"id\":391,\"uris\":[\"http://zotero

ty Computation is to enable protocol participants to compute a public function of their private inputs whil
e keeping their inputs secret, without resorting to any trusted third party. However, opening the public ou
tput of such computations inevitably reveals some information about the private inputs. We propose a measur
e generalising both Renyi entropy and g-entropy so as to quantify this information leakage. In order to con
trol and restrain such information flows, we introduce the notion of function substitution which replaces t
he computation of a function that reveals sensitive information with that of an approximate function. We ex
hibit theoretical bounds for the privacy gains that this approach provides and experimentally show that thi
s enhances the confidentiality of the inputs while controlling the distortion of computed output values. Fi
nally, we investigate the inherent compromise between accuracy of computation and privacy of inputs and we
demonstrate how to realise such optimal trade-offs.\",\"DOI\":\"10.48550/ARXIV.1803.00436\",\"license\":\"a

 of e-commerce and e-voting platforms has resulted in the rise in the volume of sensitive information over
the Internet. This has resulted in an increased demand for secure and private means of information computat
ion. Towards this, the Yao\u0027s Millionaires\u0027 problem, i.e., to determine the richer among two milli
onaires\u0027 securely, finds an application. In this work, we present a new solution to the Yao\u0027s Mil
lionaires\u0027 problem namely, Privacy Preserving Comparison (PPC). We show that PPC achieves this compari
son in constant time as well as in one execution. PPC uses semi-honest third parties for the comparison who
 do not learn any information about the values. Further, we show that PPC is collusion-resistance. To demon
strate the significance of PPC, we present a secure, approximate single-minded combinatorial auction, which
 we call TPACAS, i.e., Truthful, Privacy-preserving Approximate Combinatorial Auction for Single-minded bid
ders. We show that TPACAS, unlike previous works, preserves the following privacies relevant to an auction:
 agent privacy, the identities of the losing bidders must not be revealed to any other agent except the auc
tioneer (AU), bid privacy, the bid values must be hidden from the other agents as well as the AU and bid-to
pology privacy, the items for which the agents are bidding must be hidden from the other agents as well as
the AU. We demonstrate the practicality of TPACAS through simulations. Lastly, we also look at TPACAS\u0027
 implementation over a publicly distributed ledger, such as the Ethereum blockchain.\",\"DOI\":\"10.48550/A

stract\":\"Increasing use of computers and networks in business, government, recreation, and almost all asp
ects of daily life has led to a proliferation of online sensitive data about individuals and organizations.
 Consequently, concern about the privacy of these data has become a top priority, particularly those data t
hat are created and used in electronic commerce. There have been many formulations of privacy and, unfortun
ately, many negative results about the feasibility of maintaining privacy of sensitive data in realistic ne
tworked environments. We formulate communication-complexity-based definitions, both worst-case and average-
case, of a problem\u0027s privacy-approximation ratio. We use our definitions to investigate the extent to
which approximate privacy is achievable in two standard problems: the second-price Vickrey auction and the
millionaires problem of Yao. For both the second-price Vickrey auction and the millionaires problem, we sho
w that not only is perfect privacy impossible or infeasibly costly to achieve, but even close approximation
s of perfect privacy suffer from the same lower bounds. By contrast, we show that, if the values of the par
ties are drawn uniformly at random from {0,...,2^k-1}, then, for both problems, simple and natural communic
ation protocols have privacy-approximation ratios that are linear in k (i.e., logarithmic in the size of th
```

e space of possible inputs). We conjecture that this improved privacy-approximation ratio is achievable for
 any probability distribution.\",\"DOI\":\"10.48550/ARXIV.0910.5714\",\"license\":\"arXiv.org perpetual, no

7,\"type\":\"article-journal\",\"abstract\":\"Secure multiparty computations enable the distribution of so-
called shares of sensitive data to multiple parties such that the multiple parties can effectively process
the data while being unable to glean much information about the data (at least not without collusion among
all parties to put back together all the shares). Thus, the parties may conspire to send all their processe
d results to a trusted third party (perhaps the data provider) at the conclusion of the computations, with
only the trusted third party being able to view the final results. Secure multiparty computations for priva
cy-preserving machine-learning turn out to be possible using solely standard floating-point arithmetic, at
least with a carefully controlled leakage of information less than the loss of accuracy due to roundoff, al
l backed by rigorous mathematical proofs of worst-case bounds on information loss and numerical stability i
n finite-precision arithmetic. Numerical examples illustrate the high performance attained on commodity off
-the-shelf hardware for generalized linear models, including ordinary linear least-squares regression, bina
ry and multinomial logistic regression, probit regression, and Poisson regression.\",\"DOI\":\"10.48550/ARX

ws recommendation is critical for personalized news access. Most existing news recommendation methods rely
on centralized storage of users\u0027 historical news click behavior data, which may lead to privacy concer
ns and hazards. Federated Learning is a privacy-preserving framework for multiple clients to collaborativel
y train models without sharing their private data. However, the computation and communication cost of direc
tly learning many existing news recommendation models in a federated way are unacceptable for user clients.
 In this paper, we propose an efficient federated learning framework for privacy-preserving news recommenda
tion. Instead of training and communicating the whole model, we decompose the news recommendation model int
o a large news model maintained in the server and a light-weight user model shared on both server and clien
ts, where news representations and user model are communicated between server and clients. More specificall
y, the clients request the user model and news representations from the server, and send their locally comp
uted gradients to the server for aggregation. The server updates its global user model with the aggregated
gradients, and further updates its news model to infer updated news representations. Since the local gradie
nts may contain private information, we propose a secure aggregation method to aggregate gradients in a pri
vacy-preserving way. Experiments on two real-world datasets show that our method can reduce the computation
 and communication cost on clients while keep promising model performance.\",\"DOI\":\"10.48550/ARXIV.2109.

ws recommendation is critical for personalized news access. Most existing news recommendation methods rely
on centralized storage of users\u0027 historical news click behavior data, which may lead to privacy concer
ns and hazards. Federated Learning is a privacy-preserving framework for multiple clients to collaborativel
y train models without sharing their private data. However, the computation and communication cost of direc
tly learning many existing news recommendation models in a federated way are unacceptable for user clients.
In this paper, we propose an efficient federated learning framework for privacy-preserving news recommenda
tion. Instead of training and communicating the whole model, we decompose the news recommendation model int
o a large news model maintained in the server and a light-weight user model shared on both server and clien
ts, where news representations and user model are communicated between server and clients. More specificall
y, the clients request the user model and news representations from the server, and send their locally comp
uted gradients to the server for aggregation. The server updates its global user model with the aggregated
gradients, and further updates its news model to infer updated news representations. Since the local gradie
nts may contain private information, we propose a secure aggregation method to aggregate gradients in a pri

vacy-preserving way. Experiments on two real-world datasets show that our method can reduce the computation and communication cost on clients while keep promising model performance.\",\"DOI\":\"10.48550/ARXIV.2109.05446\",\"license\":\"arXiv.org perpetual, non-exclusive license\",\"note\":\"version: 3\",\"publisher\":\"arXiv\",\"source\":\"DOI.org (Datacite)\",\"title\":\"Efficient-FedRec: Efficient Federated Learning Framework for Privacy-Preserving News Recommendation\",\"title-short\":\"Efficient-FedRec\",\"URL\":\"https://arxiv.org/abs/2109.05446\",\"author\":[{\"family\":\"Yi\",\"given\":\"Jingwei\"},{\"family\":\"Wu\",\"given\":\"Fangzhao\"},{\"family\":\"Wu\",\"given\":\"Chuhan\"},{\"family\":\"Liu\",\"given\":\"Ruixuan\"},{\"family\":\"Sun\",\"given\":\"Guangzhong\"},{\"family\":\"Xie\",\"given\":\"Xing\"}],\"accessed\":{\"date-parts\":[[\"2026\",2,16]]},\"issued\":{\"date-parts\":[[\"2021\"]]}},{\"id\":502,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/3LGAHGWS\"],\"itemData\":{\"id\":502,\"type\":\"article-journal\",\"container-title\":\"Acm Transactions on Information Systems\",\"DOI\":\"10.1145/3779442\",\"issue\":\"2\",\"journalAbbreviation\":\"Acm Transactions on Information Systems\",\"page\":\"1-28\",\"title\":\"Beyond Similarity: Personalized Federated Recommendation With Composite Aggregation\",\"volume\":\"44\",\"author\":[{\"family\":\"Zhang\",\"given\":\"Honglei\"}],\"issued\":{\"date-parts\":[[\"2026\"]]}},{\"id\":495,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/LGPYCZ4M\"],\"itemData\":{\"id\":495,\"type\":\"article-journal\",\"container-title\":\"Computer Science and Information Systems\",\"DOI\":\"10.2298/csis250221057z\",\"issue\":\"00\",\"journalAbbreviation\":\"Computer Science and Information Systems\",\"page\":\"57-57\",\"title\":\"VSAF: Verifiable and Secure Aggregation Scheme for Federated Learning in Edge Computing\",\"author\":[{\"family\":\"Zhang\",\"given\":\"Shiwen\"},{\"family\":\"Ren\",\"given\":\"Feixiang\"},{\"family\":\"Liang\",\"given\":\"Wei\"},{\"family\":\"Li\",\"given\":\"Kuanching\"},{\"family\":\"Pathan\",\"given\":\"Al■Sakib K.\"}],\"issued\":{\"date-parts\":[[\"2025\"]]}},{\"id\":506,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/XVM7LVUQ\"],\"itemData\":{\"id\":506,\"type\":\"article-journal\",\"DOI\":\"10.48550/arxiv.2209.07807\",\"title\":\"Model Inversion Attacks Against Graph Neural Networks\",\"author\":[{\"family\":\"Zhang\",\"given\":\"Zaixi\"},{\"family\":\"Liu\",\"given\":\"Qi\"},{\"family\":\"Huang\",\"given\":\"Zhenya\"},{\"family\":\"Wang\",\"given\":\"Hao\"},{\"family\":\"Lee\",\"given\":\"Chee■Kong\"},{\"family\":\"Chen\",\"given\":\"Enhong\"}],\"issued\":{\"date-parts\":[[\"2022\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Moreover, the information of the users is not homogenous, and this is a significant threat. Most existing news recommendation methods rely on centralized storage of users\u0027 historical news click behavior data, which may lead to privacy concerns and hazards. Federated Learning is a privacy-preserving framework for multiple clients to collaboratively train models without sharing their private data. However, the computation and communication cost of directly learning many existing news recommendation models in a federated way are unacceptable for user clients. In this paper, we propose an efficient federated learning framework for privacy-preserving news recommendation. Instead of training and communicating the whole model, we decompose the news recommendation model into a large news model maintained in the server and a light-weight user model shared on both server and clients, where news representations and user model are communicated between server and clients. More specifically, the clients request the user model and news representations from the server, and send their locally computed gradients to the server for aggregation. The server updates its global user model with the aggregated gradients, and further updates its news model to infer updated news representations. Since the local gradients may contain private information, we propose a secure aggregation method to aggregate gradients in a privacy-preserving way. Experiments on two real-world datasets show that our method can reduce the computation and communication cost on clients while keep promising model performance.\",\"DOI\":\"10.48550/ARXIV.2109.05446\",\"license\":\"arXiv.org perpetual, non-exclusive license\",\"note\":\"version: 3\",\"publisher\":\"arXiv\",\"source\":\"DOI.org (Datacite)\",\"title\":\"Efficient-FedRec: Efficient Federated Learning Framework for Privacy-Preserving News Recommendation\",\"title-short\":\"Efficient-FedRec\",\"URL\":\"https://arxiv.org/abs/2109.05446\",\"author\":[{\"family\":\"Yi\",\"given\":\"Jingwei\"},{\"family\":\"Wu\",\"given\":\"Fangzhao\"},{\"family\":\"Wu\",\"given\":\"Chuhan\"},{\"family\":\"Liu\",\"given\":\"Ruixuan\"},{\"family\":\"Sun\",\"given\":\"Guangzhong\"},{\"family\":\"Xie\",\"given\":\"Xing\"}],\"accessed\":{\"date-parts\":[[\"2026\",2,16]]},\"issued\":{\"date-parts\":[[\"2021\"]]}}},{\"id\":502,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/3LGAHGWS\"],\"itemData\":{\"id\":502,\"type\":\"article-journal\",\"container-title\":\"Acm Transactions on Information Systems\",\"DOI\":\"10.1145/3779442\",\"issue\":\"2\",\"journalAbbreviation\":\"Acm Transactions on Information Systems\",\"page\":\"1-28\",\"title\":\"Beyond Similarity: Personalized Federated Recommendation With Composite Aggregation\",\"volume\":\"44\",\"author\":[{\"family\":\"Zhang\",\"given\":\"Honglei\"}],\"issued\":{\"date-parts\":[[\"2026\"]]}}},{\"id\":495,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/LGPYCZ4M\"],\"itemData\":{\"id\":495,\"type\":\"article-journal\",\"container-title\":\"Computer Science and Information Systems\",\"DOI\":\"10.2298/csis250221057z\",\"issue\":\"00\",\"journalAbbreviation\":\"Computer Science and Information Systems\",\"page\":\"57-57\",\"title\":\"VSAF: Verifiable and Secure Aggregation Scheme for Federated Learning in Edge Computing\",\"author\":[{\"family\":\"Zhang\",\"given\":\"Shiwen\"},{\"family\":\"Ren\",\"given\":\"Feixiang\"},{\"family\":\"Liang\",\"given\":\"Wei\"},{\"family\":\"Li\",\"given\":\"Kuanching\"},{\"family\":\"Pathan\",\"given\":\"Al■Sakib K.\"}],\"issued\":{\"date-parts\":[[\"2025\"]]}}},{\"id\":506,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/XVM7LVUQ\"],\"itemData\":{\"id\":506,\"type\":\"article-journal\",\"DOI\":\"10.48550/arxiv.2209.07807\",\"title\":\"Model Inversion Attacks Against Graph Neural Networks\",\"author\":[{\"family\":\"Zhang\",\"given\":\"Zaixi\"},{\"family\":\"Liu\",\"given\":\"Qi\"},{\"family\":\"Huang\",\"given\":\"Zhenya\"},{\"family\":\"Wang\",\"given\":\"Hao\"},{\"family\":\"Lee\",\"given\":\"Chee■Kong\"},{\"family\":\"Chen\",\"given\":\"Enhong\"}],\"issued\":{\"date-parts\":[[\"2022\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Moreover, the information of the users is not homogenous, and this is a significant threat. In practice user data in any realistic context are usually not expected to be typically independent and identically distributed (non-IID), and the tendency of the distributions of preferences, the distributions of interaction dissipating across a wide spectrum are likely to occur because of the conditions of a circumstance or demographic usage. Such a non-IID character can result in the biased models of the world, a reduced rate and quality of convergence, and such models are local and trained on independently specific data, which should not be aggregated to perform an adequate generalization. ws recommendation is critical for personalized news access. Most existing news recommendation methods rely
on centralized storage of users\u0027 historical news click behavior data, which may lead to privacy concer
ns and hazards. Federated Learning is a privacy-preserving framework for multiple clients to collaborativel
y train models without sharing their private data. However, the computation and communication cost of direc
tly learning many existing news recommendation models in a federated way are unacceptable for user clients.
In this paper, we propose an efficient federated learning framework for privacy-preserving news recommenda
tion. Instead of training and communicating the whole model, we decompose the news recommendation model int
o a large news model maintained in the server and a light-weight user model shared on both server and clien
ts, where news representations and user model are communicated between server and clients. More specificall
y, the clients request the user model and news representations from the server, and send their locally comp
uted gradients to the server for aggregation. The server updates its global user model with the aggregated
gradients, and further updates its news model to infer updated news representations. Since the local gradie
nts may contain private information, we propose a secure aggregation method to aggregate gradients in a pri
vacy-preserving way. Experiments on two real-world datasets show that our method can reduce the computation
and communication cost on clients while keep promising model performance.\",\"DOI\":\"10.48550/ARXIV.2109.

ws recommendation is critical for personalized news access. Most existing news recommendation methods rely
on centralized storage of users\u0027 historical news click behavior data, which may lead to privacy concer
ns and hazards. Federated Learning is a privacy-preserving framework for multiple clients to collaborativel
y train models without sharing their private data. However, the computation and communication cost of direc
tly learning many existing news recommendation models in a federated way are unacceptable for user clients.
 In this paper, we propose an efficient federated learning framework for privacy-preserving news recommenda
tion. Instead of training and communicating the whole model, we decompose the news recommendation model int
o a large news model maintained in the server and a light-weight user model shared on both server and clien

ts, where news representations and user model are communicated between server and clients. More specificall
y, the clients request the user model and news representations from the server, and send their locally comp
uted gradients to the server for aggregation. The server updates its global user model with the aggregated
gradients, and further updates its news model to infer updated news representations. Since the local gradie
nts may contain private information, we propose a secure aggregation method to aggregate gradients in a pri
vacy-preserving way. Experiments on two real-world datasets show that our method can reduce the computation
 and communication cost on clients while keep promising model performance.\",\"DOI\":\"10.48550/ARXIV.2109.

ws recommendation is critical for personalized news access. Most existing news recommendation methods rely
on centralized storage of users\u0027 historical news click behavior data, which may lead to privacy concer
ns and hazards. Federated Learning is a privacy-preserving framework for multiple clients to collaborativel
y train models without sharing their private data. However, the computation and communication cost of direc
tly learning many existing news recommendation models in a federated way are unacceptable for user clients.
 In this paper, we propose an efficient federated learning framework for privacy-preserving news recommenda
tion. Instead of training and communicating the whole model, we decompose the news recommendation model int
o a large news model maintained in the server and a light-weight user model shared on both server and clien
ts, where news representations and user model are communicated between server and clients. More specificall
y, the clients request the user model and news representations from the server, and send their locally comp
uted gradients to the server for aggregation. The server updates its global user model with the aggregated
gradients, and further updates its news model to infer updated news representations. Since the local gradie
nts may contain private information, we propose a secure aggregation method to aggregate gradients in a pri
vacy-preserving way. Experiments on two real-world datasets show that our method can reduce the computation
 and communication cost on clients while keep promising model performance.\",\"DOI\":\"10.48550/ARXIV.2109.

ws recommendation is critical for personalized news access. Most existing news recommendation methods rely
on centralized storage of users\u0027 historical news click behavior data, which may lead to privacy concer
ns and hazards. Federated Learning is a privacy-preserving framework for multiple clients to collaborativel
y train models without sharing their private data. However, the computation and communication cost of direc
tly learning many existing news recommendation models in a federated way are unacceptable for user clients.
 In this paper, we propose an efficient federated learning framework for privacy-preserving news recommenda
tion. Instead of training and communicating the whole model, we decompose the news recommendation model int
o a large news model maintained in the server and a light-weight user model shared on both server and clien
ts, where news representations and user model are communicated between server and clients. More specificall
y, the clients request the user model and news representations from the server, and send their locally comp
uted gradients to the server for aggregation. The server updates its global user model with the aggregated
gradients, and further updates its news model to infer updated news representations. Since the local gradie
nts may contain private information, we propose a secure aggregation method to aggregate gradients in a pri
vacy-preserving way. Experiments on two real-world datasets show that our method can reduce the computation
 and communication cost on clients while keep promising model performance.\",\"DOI\":\"10.48550/ARXIV.2109.

ws recommendation is critical for personalized news access. Most existing news recommendation methods rely
on centralized storage of users\u0027 historical news click behavior data, which may lead to privacy concer
ns and hazards. Federated Learning is a privacy-preserving framework for multiple clients to collaborativel
y train models without sharing their private data. However, the computation and communication cost of direc
tly learning many existing news recommendation models in a federated way are unacceptable for user clients.
 In this paper, we propose an efficient federated learning framework for privacy-preserving news recommenda
tion. Instead of training and communicating the whole model, we decompose the news recommendation model int
o a large news model maintained in the server and a light-weight user model shared on both server and clien
ts, where news representations and user model are communicated between server and clients. More specificall
y, the clients request the user model and news representations from the server, and send their locally comp
uted gradients to the server for aggregation. The server updates its global user model with the aggregated
gradients, and further updates its news model to infer updated news representations. Since the local gradie
nts may contain private information, we propose a secure aggregation method to aggregate gradients in a pri
vacy-preserving way. Experiments on two real-world datasets show that our method can reduce the computation
 and communication cost on clients while keep promising model performance.\",\"DOI\":\"10.48550/ARXIV.2109.

recommendation is critical for personalized news access. Most existing news recommendation methods rely on centralized storage of users\u0027 historical news click behavior data, which may lead to privacy concerns and hazards. Federated Learning is a privacy-preserving framework for multiple clients to collaboratively train models without sharing their private data. However, the computation and communication cost of directly learning many existing news recommendation models in a federated way are unacceptable for user clients. In this paper, we propose an efficient federated learning framework for privacy-preserving news recommendation. Instead of training and communicating the whole model, we decompose the news recommendation model into a large news model maintained in the server and a light-weight user model shared on both server and clients, where news representations and user model are communicated between server and clients. More specifically, the clients request the user model and news representations from the server, and send their locally computed gradients to the server for aggregation. The server updates its global user model with the aggregated gradients, and further updates its news model to infer updated news representations. Since the local gradients may contain private information, we propose a secure aggregation method to aggregate gradients in a privacy-preserving way. Experiments on two real-world datasets show that our method can reduce the computation and communication cost on clients while keep promising model performance.\",\"DOI\":\"10.48550/ARXIV.2109.05446\",\"license\":\"arXiv.org perpetual, non-exclusive license\",\"note\":\"version: 3\",\"publisher\":\"arXiv\",\"source\":\"DOI.org (Datacite)\",\"title\":\"Efficient-FedRec: Efficient Federated Learning Framework for Privacy-Preserving News Recommendation\",\"title-short\":\"Efficient-FedRec\",\"URL\":\"https://arxiv.org/abs/2109.05446\",\"author\":[{\"family\":\"Yi\",\"given\":\"Jingwei\"},{\"family\":\"Wu\",\"given\":\"Fangzhao\"},{\"family\":\"Wu\",\"given\":\"Chuhan\"},{\"family\":\"Liu\",\"given\":\"Ruixuan\"},{\"family\":\"Sun\",\"given\":\"Guangzhong\"},{\"family\":\"Xie\",\"given\":\"Xing\"}],\"accessed\":{\"date-parts\":[[\"2026\",2,16]]},\"issued\":{\"date-parts\":[[\"2021\"]]}}},{\"id\":502,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/3LGAHGWS\"],\"itemData\":{\"id\":502,\"type\":\"article-journal\",\"container-title\":\"Acm Transactions on Information Systems\",\"DOI\":\"10.1145/3779442\",\"issue\":\"2\",\"journalAbbreviation\":\"Acm Transactions on Information Systems\",\"page\":\"1-28\",\"title\":\"Beyond Similarity: Person

ws recommendation is critical for personalized news access. Most existing news recommendation methods rely
on centralized storage of users\u0027 historical news click behavior data, which may lead to privacy concer
ns and hazards. Federated Learning is a privacy-preserving framework for multiple clients to collaborativel
y train models without sharing their private data. However, the computation and communication cost of direc
tly learning many existing news recommendation models in a federated way are unacceptable for user clients.
 In this paper, we propose an efficient federated learning framework for privacy-preserving news recommenda
tion. Instead of training and communicating the whole model, we decompose the news recommendation model int
o a large news model maintained in the server and a light-weight user model shared on both server and clien
ts, where news representations and user model are communicated between server and clients. More specificall
y, the clients request the user model and news representations from the server, and send their locally comp
uted gradients to the server for aggregation. The server updates its global user model with the aggregated
gradients, and further updates its news model to infer updated news representations. Since the local gradie
nts may contain private information, we propose a secure aggregation method to aggregate gradients in a pri
vacy-preserving way. Experiments on two real-world datasets show that our method can reduce the computation
 and communication cost on clients while keep promising model performance.\",\"DOI\":\"10.48550/ARXIV.2109.

ws recommendation is critical for personalized news access. Most existing news recommendation methods rely
on centralized storage of users\u0027 historical news click behavior data, which may lead to privacy concer
ns and hazards. Federated Learning is a privacy-preserving framework for multiple clients to collaborativel
y train models without sharing their private data. However, the computation and communication cost of direc
tly learning many existing news recommendation models in a federated way are unacceptable for user clients.
 In this paper, we propose an efficient federated learning framework for privacy-preserving news recommenda
tion. Instead of training and communicating the whole model, we decompose the news recommendation model int
o a large news model maintained in the server and a light-weight user model shared on both server and clien
ts, where news representations and user model are communicated between server and clients. More specificall
y, the clients request the user model and news representations from the server, and send their locally comp
uted gradients to the server for aggregation. The server updates its global user model with the aggregated
gradients, and further updates its news model to infer updated news representations. Since the local gradie
nts may contain private information, we propose a secure aggregation method to aggregate gradients in a pri
vacy-preserving way. Experiments on two real-world datasets show that our method can reduce the computation
 and communication cost on clients while keep promising model performance.\",\"DOI\":\"10.48550/ARXIV.2109.

recommendation is critical for personalized news access. Most existing news recommendation methods rely on centralized storage of users\u0027 historical news click behavior data, which may lead to privacy concerns and hazards. Federated Learning is a privacy-preserving framework for multiple clients to collaboratively train models without sharing their private data. However, the computation and communication cost of directly learning many existing news recommendation models in a federated way are unacceptable for user clients. In this paper, we propose an efficient federated learning framework for privacy-preserving news recommendation. Instead of training and communicating the whole model, we decompose the news recommendation model into a large news model maintained in the server and a light-weight user model shared on both server and clients, where news representations and user model are communicated between server and clients. More specifically, the clients request the user model and news representations from the server, and send their locally computed gradients to the server for aggregation. The server updates its global user model with the aggregated gradients, and further updates its news model to infer updated news representations. Since the local gradients may contain private information, we propose a secure aggregation method to aggregate gradients in a privacy-preserving way. Experiments on two real-world datasets show that our method can reduce the computation and communication cost on clients while keep promising model performance.\",\"DOI\":\"10.48550/ARXIV.2109.05446\",\"license\":\"arXiv.org perpetual, non-exclusive license\",\"note\":\"version: 3\",\"publisher\":\"arXiv\",\"source\":\"DOI.org (Datacite)\",\"title\":\"Efficient-FedRec: Efficient Federated Learning Framework for Privacy-Preserving News Recommendation\",\"title-short\":\"Efficient-FedRec\",\"URL\":\"https://arx

ws recommendation is critical for personalized news access. Most existing news recommendation methods rely
on centralized storage of users\u0027 historical news click behavior data, which may lead to privacy concer
ns and hazards. Federated Learning is a privacy-preserving framework for multiple clients to collaborativel
y train models without sharing their private data. However, the computation and communication cost of direc
tly learning many existing news recommendation models in a federated way are unacceptable for user clients.
 In this paper, we propose an efficient federated learning framework for privacy-preserving news recommenda
tion. Instead of training and communicating the whole model, we decompose the news recommendation model int
o a large news model maintained in the server and a light-weight user model shared on both server and clien
ts, where news representations and user model are communicated between server and clients. More specificall
y, the clients request the user model and news representations from the server, and send their locally comp
uted gradients to the server for aggregation. The server updates its global user model with the aggregated
gradients, and further updates its news model to infer updated news representations. Since the local gradie
nts may contain private information, we propose a secure aggregation method to aggregate gradients in a pri
vacy-preserving way. Experiments on two real-world datasets show that our method can reduce the computation
 and communication cost on clients while keep promising model performance.\",\"DOI\":\"10.48550/ARXIV.2109.

ws recommendation is critical for personalized news access. Most existing news recommendation methods rely
on centralized storage of users\u0027 historical news click behavior data, which may lead to privacy concer
ns and hazards. Federated Learning is a privacy-preserving framework for multiple clients to collaborativel
y train models without sharing their private data. However, the computation and communication cost of direc
tly learning many existing news recommendation models in a federated way are unacceptable for user clients.
In this paper, we propose an efficient federated learning framework for privacy-preserving news recommenda
tion. Instead of training and communicating the whole model, we decompose the news recommendation model int
o a large news model maintained in the server and a light-weight user model shared on both server and clien
ts, where news representations and user model are communicated between server and clients. More specificall
y, the clients request the user model and news representations from the server, and send their locally comp
uted gradients to the server for aggregation. The server updates its global user model with the aggregated
gradients, and further updates its news model to infer updated news representations. Since the local gradie
nts may contain private information, we propose a secure aggregation method to aggregate gradients in a pri
vacy-preserving way. Experiments on two real-world datasets show that our method can reduce the computation
and communication cost on clients while keep promising model performance.\",\"DOI\":\"10.48550/ARXIV.2109.

In evaluating the effectiveness of federated movie recommenders using varying privacy settings we do also consider their effectiveness in terms of local training epochs and also client sampling plan and aggregation plan on data. Specifically, we examine implications of such a privacy-related trade-offs as lossless noise multipliers to privacy budget and privacy level indicator (e.g., specifies privacy level 5) does affect such valuable indicators as recommendation precision, recall, NDCG and user experience indicators (e.g., rate of session satisfaction). The ancillary costs we also measure (in terms of CPU or GPU cycles used to perform an encryption or noise addition, network overheads (also called secure aggregations), battery overheads, and latency spurts) are then tested in actual mobile hardware (Android phones). e problems of trade-offs between accuracy and privacy in the federated learning are referred to in the prov
ided paper using the case of the movie recommender systems in mobile devices. In evaluating the effectivene
ss of federated movie recommenders using varying privacy settings we do also consider their effectiveness i
n terms of local training epochs and also client sampling plan and aggregation plan on data. Specifically,
we examine implications of such a privacy-related trade-offs as lossless noise multipliers to privacy budge
t and privacy level indicator (e.g., specifies privacy level 5) does affect such valuable indicators as rec
ommendation precision, recall, NDCG and user experience indicators (e.g., rate of session satisfaction). Th
e ancillary costs we also measure (in terms of CPU or GPU cycles used to perform an encryption or noise add
ition, network overheads (also called secure aggregations), battery overheads, and latency spurts) are then
 tested in actual mobile hardware (Android phones). (Ahmadzai \u0026 Nguyen, 2024; Z. Chen et al., 2022a; Z

5\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Th
e problems of trade-offs between accuracy and privacy in the federated learning are referred to in the prov
ided paper using the case of the movie recommender systems in mobile devices. In evaluating the effectivene
ss of federated movie recommenders using varying privacy settings we do also consider their effectiveness i
n terms of local training epochs and also client sampling plan and aggregation plan on data. Specifically, 
we examine implications of such a privacy-related trade-offs as lossless noise multipliers to privacy budge
t and privacy level indicator (e.g., specifies privacy level 5) does affect such valuable indicators as rec
ommendation precision, recall, NDCG and user experience indicators (e.g., rate of session satisfaction). Th
e ancillary costs we also measure (in terms of CPU or GPU cycles used to perform an encryption or noise add
ition, network overheads (also called secure aggregations), battery overheads, and latency spurts) are then
 tested in actual mobile hardware (Android phones). (Ahmadzai \u0026 Nguyen, 2024; Z. Chen et al., 2022a; Z

5\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Th
e problems of trade-offs between accuracy and privacy in the federated learning are referred to in the prov
ided paper using the case of the movie recommender systems in mobile devices. In evaluating the effectivene
ss of federated movie recommenders using varying privacy settings we do also consider their effectiveness i
n terms of local training epochs and also client sampling plan and aggregation plan on data. Specifically, 
we examine implications of such a privacy-related trade-offs as lossless noise multipliers to privacy budge
t and privacy level indicator (e.g., specifies privacy level 5) does affect such valuable indicators as rec
ommendation precision, recall, NDCG and user experience indicators (e.g., rate of session satisfaction). Th
e ancillary costs we also measure (in terms of CPU or GPU cycles used to perform an encryption or noise add
ition, network overheads (also called secure aggregations), battery overheads, and latency spurts) are then
 tested in actual mobile hardware (Android phones). (Ahmadzai \u0026 Nguyen, 2024; Z. Chen et al., 2022a; Z

e problems of trade-offs between accuracy and privacy in the federated learning are referred to in the prov
ided paper using the case of the movie recommender systems in mobile devices. In evaluating the effectivene
ss of federated movie recommenders using varying privacy settings we do also consider their effectiveness i
n terms of local training epochs and also client sampling plan and aggregation plan on data. Specifically, 
we examine implications of such a privacy-related trade-offs as lossless noise multipliers to privacy budge
t and privacy level indicator (e.g., specifies privacy level 5) does affect such valuable indicators as rec
ommendation precision, recall, NDCG and user experience indicators (e.g., rate of session satisfaction). Th
e ancillary costs we also measure (in terms of CPU or GPU cycles used to perform an encryption or noise add
ition, network overheads (also called secure aggregations), battery overheads, and latency spurts) are then
 tested in actual mobile hardware (Android phones). (Ahmadzai \u0026 Nguyen, 2024; Z. Chen et al., 2022a; Z

5\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Th
e problems of trade-offs between accuracy and privacy in the federated learning are referred to in the prov
ided paper using the case of the movie recommender systems in mobile devices. In evaluating the effectivene
ss of federated movie recommenders using varying privacy settings we do also consider their effectiveness i
n terms of local training epochs and also client sampling plan and aggregation plan on data. Specifically,
we examine implications of such a privacy-related trade-offs as lossless noise multipliers to privacy budge
t and privacy level indicator (e.g., specifies privacy level 5) does affect such valuable indicators as rec
ommendation precision, recall, NDCG and user experience indicators (e.g., rate of session satisfaction). Th
e ancillary costs we also measure (in terms of CPU or GPU cycles used to perform an encryption or noise add
ition, network overheads (also called secure aggregations), battery overheads, and latency spurts) are then
 tested in actual mobile hardware (Android phones). (Ahmadzai \u0026 Nguyen, 2024; Z. Chen et al., 2022a; Z

5\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Th
e problems of trade-offs between accuracy and privacy in the federated learning are referred to in the prov
ided paper using the case of the movie recommender systems in mobile devices. In evaluating the effectivene
ss of federated movie recommenders using varying privacy settings we do also consider their effectiveness i
n terms of local training epochs and also client sampling plan and aggregation plan on data. Specifically,
we examine implications of such a privacy-related trade-offs as lossless noise multipliers to privacy budge
t and privacy level indicator (e.g., specifies privacy level 5) does affect such valuable indicators as rec
ommendation precision, recall, NDCG and user experience indicators (e.g., rate of session satisfaction). Th
e ancillary costs we also measure (in terms of CPU or GPU cycles used to perform an encryption or noise add
ition, network overheads (also called secure aggregations), battery overheads, and latency spurts) are then
tested in actual mobile hardware (Android phones). (Ahmadzai \u0026 Nguyen, 2024; Z. Chen et al., 2022a; Z

5\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Th
e problems of trade-offs between accuracy and privacy in the federated learning are referred to in the prov
ided paper using the case of the movie recommender systems in mobile devices. In evaluating the effectivene
ss of federated movie recommenders using varying privacy settings we do also consider their effectiveness i
n terms of local training epochs and also client sampling plan and aggregation plan on data. Specifically,
we examine implications of such a privacy-related trade-offs as lossless noise multipliers to privacy budge
t and privacy level indicator (e.g., specifies privacy level 5) does affect such valuable indicators as rec
ommendation precision, recall, NDCG and user experience indicators (e.g., rate of session satisfaction). Th
e ancillary costs we also measure (in terms of CPU or GPU cycles used to perform an encryption or noise add
ition, network overheads (also called secure aggregations), battery overheads, and latency spurts) are then
 tested in actual mobile hardware (Android phones). (Ahmadzai \u0026 Nguyen, 2024; Z. Chen et al., 2022a; Z

5\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Th
e problems of trade-offs between accuracy and privacy in the federated learning are referred to in the prov
ided paper using the case of the movie recommender systems in mobile devices. In evaluating the effectivene
ss of federated movie recommenders using varying privacy settings we do also consider their effectiveness i
n terms of local training epochs and also client sampling plan and aggregation plan on data. Specifically,
we examine implications of such a privacy-related trade-offs as lossless noise multipliers to privacy budge
t and privacy level indicator (e.g., specifies privacy level 5) does affect such valuable indicators as rec
ommendation precision, recall, NDCG and user experience indicators (e.g., rate of session satisfaction). Th
e ancillary costs we also measure (in terms of CPU or GPU cycles used to perform an encryption or noise add
ition, network overheads (also called secure aggregations), battery overheads, and latency spurts) are then
 tested in actual mobile hardware (Android phones). (Ahmadzai \u0026 Nguyen, 2024; Z. Chen et al., 2022a; Z

5\"]]}}}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Th
e problems of trade-offs between accuracy and privacy in the federated learning are referred to in the prov
ided paper using the case of the movie recommender systems in mobile devices. In evaluating the effectivene
ss of federated movie recommenders using varying privacy settings we do also consider their effectiveness i
n terms of local training epochs and also client sampling plan and aggregation plan on data. Specifically,
we examine implications of such a privacy-related trade-offs as lossless noise multipliers to privacy budge
t and privacy level indicator (e.g., specifies privacy level 5) does affect such valuable indicators as rec
ommendation precision, recall, NDCG and user experience indicators (e.g., rate of session satisfaction). Th
e ancillary costs we also measure (in terms of CPU or GPU cycles used to perform an encryption or noise add
ition, network overheads (also called secure aggregations), battery overheads, and latency spurts) are then
 tested in actual mobile hardware (Android phones). (Ahmadzai \u0026 Nguyen, 2024; Z. Chen et al., 2022a; Z

e problems of trade-offs between accuracy and privacy in the federated learning are referred to in the prov
ided paper using the case of the movie recommender systems in mobile devices. In evaluating the effectivene
ss of federated movie recommenders using varying privacy settings we do also consider their effectiveness i
n terms of local training epochs and also client sampling plan and aggregation plan on data. Specifically,
we examine implications of such a privacy-related trade-offs as lossless noise multipliers to privacy budge
t and privacy level indicator (e.g., specifies privacy level 5) does affect such valuable indicators as rec
ommendation precision, recall, NDCG and user experience indicators (e.g., rate of session satisfaction). Th
e ancillary costs we also measure (in terms of CPU or GPU cycles used to perform an encryption or noise add
ition, network overheads (also called secure aggregations), battery overheads, and latency spurts) are then
 tested in actual mobile hardware (Android phones). (Ahmadzai \u0026 Nguyen, 2024; Z. Chen et al., 2022a; Z

style-language/schema/raw/master/csl-citation.json\"} In a collaborative machine learning innovation, feder
ated systems such as FedSlate develop these recommendations systems to be designed in such a way that more
than two parties collaboratively learn a model without the agencies having to share user information (altho
ugh eventually they might share it indirectly). However, the advantages of such approaches are potentially
negative impacts on uneven distribution of benefits among parties involved. More specifically, organisation
s or sites with fewer users (probably due to limited numbers or reduced analysability) are more likely to s
ee increased accuracy of the recommendation than the ones with stronger sources of feedback. The rationale
of this relationship is that privacy-saving techniques and, in particular, privacy introduce noise to user
data to the extent of blurring personal identities. With less information entities, it can be used to have
a positive mask to fill the gaps of information and more or less equalises the playing field. Conversely, t
he user feedback is abundant and high quality on participants making them, it may easily become diluted by
the same noise and reduces the accuracy of the recommendations thereby causing a lowered user satisfaction.

However, centralized recommendation systems raise numerous data privacy concerns. Federated learning addresses these concerns by allowing model training on client devices and aggregating model parameters without sharing raw data. Nevertheless, federated learning faces critical challenges related to feature extraction efficiency and noise sensitivity, limiting its application in e-commerce recommendation systems where data heterogeneity and high-dimensional features are prevalent. To address these gaps, this paper introduces a novel multi-view fede

rated learning framework, Fed-FR-MVD, designed to enhance feature extraction efficiency and improve recomme
ndation accuracy in e-commerce applications. Fed-FR-MVD integrates a FR mechanism within a multi-view struc
ture, incorporating both item and user perspectives to improve feature representation and robustness. This
approach yields a 12%-18% increase in recommendation accuracy across various performance metrics compared t
o single-view and other multi-view methods. By addressing data heterogeneity and optimizing feature utiliza
tion through dynamic rescaling, Fed-FR-MVD effectively mitigates the impact of noisy data, with performance
 maintained across noise levels of 5%-15%. Experimental results demonstrate that Fed-FR-MVD fills a key res
earch gap by providing a more resilient and efficient framework for federated recommendation systems in pri
vacy-sensitive and data-diverse e-commerce environments.\",\"container-title\":\"Scientific Reports\",\"DOI

rticle-journal\",\"abstract\":\"With the popularity of big data, people get less useful information because
 of the large amount of data, which makes the Recommender System come into being. However, the privacy and
accuracy of the Recommender System still have great challenges. To address these challenges, an efficient p
ersonalized recommendation scheme is proposed based on Federated Learning with similarity ciphertext calcul
ation. In this paper, we first design a Similarity calculation algorithm based on Orthogonal Matrix in Ciph
ertext (SOMC), which can compute the Similarity between users’ demand and Items’ attributes under ciphertex
t with a low calculation cost. Based on SOMC, we construct an efficient recommendation scheme by employing
the Federated Learning framework. The important feature of the proposed approach is improving the accuracy
of recommendation while ensuring the privacy of both the users and the Agents. Furthermore, the Agents with
 good performance are selected according to their Reliability scores to participate in the federal recommen
dation, so as to further make the accuracy of recommendation better. Under the defined threat model, it is
proved that the proposed scheme can meet the privacy requirements of users and Agents. Experiments show tha
t the proposed scheme has optimized accuracy and efficiency compared with existing schemes.\",\"container-t

article-journal\",\"abstract\":\"As big data technologies continue to evolve, recommendation systems have f
ound broad application in domains such as online retail and social networking platforms. However, centraliz
ed recommendation systems raise numerous data privacy concerns. Federated learning addresses these concerns
 by allowing model training on client devices and aggregating model parameters without sharing raw data. Ne
vertheless, federated learning faces critical challenges related to feature extraction efficiency and noise
 sensitivity, limiting its application in e-commerce recommendation systems where data heterogeneity and hi
gh-dimensional features are prevalent. To address these gaps, this paper introduces a novel multi-view fede
rated learning framework, Fed-FR-MVD, designed to enhance feature extraction efficiency and improve recomme
ndation accuracy in e-commerce applications. Fed-FR-MVD integrates a FR mechanism within a multi-view struc
ture, incorporating both item and user perspectives to improve feature representation and robustness. This
approach yields a 12%-18% increase in recommendation accuracy across various performance metrics compared t
o single-view and other multi-view methods. By addressing data heterogeneity and optimizing feature utiliza
```

tion through dynamic rescaling, Fed-FR-MVD effectively mitigates the impact of noisy data, with performance maintained across noise levels of 5%-15%. Experimental results demonstrate that Fed-FR-MVD fills a key research gap by providing a more resilient and efficient framework for federated recommendation systems in privacy-sensitive and data-diverse e-commerce environments.\",\"container-title\":\"Scientific Reports\",\"DOI\":\"10.1038/s41598-024-81278-1\",\"issue\":\"1\",\"journalAbbreviation\":\"Scientific Reports\",\"title\":\"Federated Cross-View E-Commerce Recommendation Based on Feature Rescaling\",\"volume\":\"14\",\"author\":[{\"family\":\"Li\",\"given\":\"Ruiheng\"},{\"family\":\"Shu\",\"given\":\"Yuhang\"},{\"family\":\"Cao\",\"given\":\"Yue\"},{\"family\":\"Luo\",\"given\":\"Yiming\"},{\"family\":\"Zuo\",\"given\":\"Qiankun\"},{\"family\":\"Wu\",\"given\":\"Xuan\"},{\"family\":\"Yu\",\"given\":\"Jiaojiao\"},{\"family\":\"Zhang\",\"given\":\"Wenxin\"}],\"issued\":{\"date-parts\":[[\"2024\"]]}}},{\"id\":543,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/FKLR62K3\"],\"itemData\":{\"id\":543,\"type\":\"article-journal\",\"abstract\":\"With rising concerns about privacy, developing recommendation systems in a federated setting become a new paradigm to develop next-generation Internet service architecture. However, existing approaches are usually derived from a distributed recommendation framework with an additional mechanism for privacy protection, thus most of them fail to fully exploit personalization in the new context of federated recommendation settings. In this paper, we propose a novel approach called Federated Recommendation with Additive Personalization (FedRAP) to enhance recommendation by learning user embedding and the user\u0027s personal view of item embeddings. Specifically, the proposed additive personalization is to add a personalized item embedding to a sparse global item embedding aggregated from all users. Moreover, a curriculum learning mechanism has been applied for additive personalization on item embeddings by gradually increasing regularization weights to mitigate the performance degradation caused by large variances among client-specific item embeddings. A unified formulation has been proposed with a sparse regularization of global item embeddings for reducing communication overhead. Experimental results on four real-world recommendation datasets demonstrate the effectiveness of FedRAP.\",\"DOI\":\"10.48550/arxiv.2301.09109\",\"title\":\"Federated Recommendation With Additive Personalization\",\"author\":[{\"family\":\"Li\",\"given\":\"Zhiwei\"},{\"family\":\"Long\",\"given\":\"Guodong\"},{\"family\":\"Zhou\",\"given\":\"Tianyi\"}],\"issued\":{\"date-parts\":[[\"2023\"]]}}},{\"id\":541,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/BLQVD2YL\"],\"itemData\":{\"id\":541,\"type\":\"article-journal\",\"abstract\":\"Federated learning is an innovative machine learning technique that deals with centralized data storage issues while maintaining privacy and security. It involves constructing machine learning models using datasets spread across several data centers, including medical facilities, clinical research facilities, Internet of Things devices, and even mobile devices. The main goal of federated learning is to improve robust models that benefit from the collective knowledge of these disparate datasets without centralizing sensitive information, reducing the risk of data loss, privacy breaches, or data exposure. The application of federated learning in the healthcare industry holds significant promise due to the wealth of data generated from various sources, such as patient records, medical imaging, wearable devices, and clinical research surveys. This research conducts a systematic evaluation and highlights essential issues for the selection and implementation of federated learning approaches in healthcare. It evaluates the effectiveness of federated learning strategies in the field of healthcare. It offers a systematic analysis of federated learning in the healthcare domain, encompassing the evaluation metrics employed. Unlike existing privacy-preserving technologies such as federated learning and differential privacy, we explore another way to mitigate users\u0027 privacy concerns, giving them control over their own data. For this goal, we propose a privacy aware recommendation framework that gives users delicate control over their personal data, including implicit behaviors, e.g., clicks and watches. In this new framework, users can proactively control which data to disclose based on the trade-off between anticipated privacy risks and potential utilities. Then we study users\u0027 privacy decision making under different data disclosure mechanisms and recommendation models, and how their data disclosure decisions affect the recommender system\u0027s performance.To avoid the high cost of real-world experiments, we apply simulations to study the effects of our proposed framework. Specifically, we propose a reinforcement learning algorithm to simulate users\u0027 decisions (with various sensitivities) under three proposed platform mechanisms on two datasets with three representative recommendation models. The simulation results show that the platform mechanisms with finer split granularity and more unrestrained disclosure strategy can bring better results for both end users and platforms than the \\\"all or nothing\\\" binary mechanism adopted by most real-world applications. It also shows that our proposed framework can effectively protect users\u0027 privacy since they can obtain comparable or even better results with much less disclosed data.\",\"DOI\":\"10.48550/arxiv.2204.00279\",\"title\":\"Studying the Impact of Data Disclosure Mechanism in Recommender Systems via Simulation\",\"author\":[{\"family\":\"Chen\",\"given\":\"Ziqian\"},{\"family\":\"Sun\",\"given\":\"Fei\"},{\"family\":\"Tang\",\"given\":\"Yifan\"},{\"family\":\"Chen\",\"given\":\"Haokun\"},{\"family\":\"Gao\",\"given\":\"Jinyang\"},{\"family\":\"Ding\",\"given\":\"Bolin\"}],\"issued\":{\"date-parts\":[[\"2022\"]]}}},{\"id\":544,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/5GQ9B68L\"],\"itemData\":{\"id\":544,\"type\":\"article-journal\",\"abstract\":\"Federated Semi-supervised Learning (FSSL) combines techniques from both fields of federated and semi- supervised learning to improve the accuracy and performance of models in a distributed environment by using a small fraction of labeled data and a large amount of unlabeled data. Without the need tocentralize all data in one place for training, it collect updates of model training after devices train models at local, and thus can protect the privacy of user data. However, during the federal training process, some of the devices fail to collect enough data for local training, while new devices will be included to the group training. This leads to an unbalanced global data distribution and thus af ect the performance of the global model training. Most of the current research is focusing on class imbalance with a fixednumber of classes, while little attention is paid to data imbalance with a variable number of classes. Therefore, in this paper, we propose Federated Semi-supervised Learning for Class Variable Imbalance (FCVI) to solve class variable imbalance. The class-variable learning algorithm is used to mitigate the data imbalance due to changes of the number of classes. Our scheme is proved to be significantly better than baseline methods, while maintaining client privacy.\",\"container-title\":\"Computer Science, Engineering and Applications\",\"DOI\":\"10.5121/csit.2023.130522\",\"journalAbbreviation\":\"Computer Science, Engineering and Applications\",\"page\":\"257-272\",\"title\":\"Addressing Class Variable Imbalance in Federated Semi-Supervised Learning\",\"author\":[{\"family\":\"Dong\",\"given\":\"Zehui\"},{\"family\":\"Liu\",\"given\":\"Wenjing\"},{\"family\":\"Liu\",\"given\":\"Siyuan\"},{\"family\":\"Chen\",\"given\":\"Xingzhi\"}],\"issued\":{\"date-parts\":[[\"2023\"]]}}},{\"id\":539,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/ASC3IKVI\"],\"itemData\":{\"id\":539,\"type\":\"article-journal\",\"abstract\":\"As big data technologies continue to evolve, recommendation systems have found broad application in domains such as online retail and social networking platforms. However, centralized recommendation systems raise numerous data privacy concerns. Federated learning addresses these concerns by allowing model training on client devices and aggregating model parameters without sharing raw data. Nevertheless, federated learning faces critical challenges related to feature extraction efficiency and noise sensitivity, limiting its application in e-commerce recommendation systems where data heterogeneity and high-dimensional features are prevalent. To address these gaps, this paper introduces a novel multi-view federated learning framework, Fed-FR-MVD, designed to enhance feature extraction efficiency and improve recommendation accuracy in e-commerce applications. Fed-FR-MVD integrates a FR mechanism within a multi-view structure, incorporating both item and user perspectives to improve feature representation and robustness. This approach yields a 12%-18% increase in recommendation accuracy across various performance metrics compared to single-view and other multi-view methods. By addressing data heterogeneity and optimizing feature utilization through dynamic rescaling, Fed-FR-MVD effectively mitigates the impact of noisy data, with performance maintained across noise levels of 5%-15%. Experimental results demonstrate that Fed-FR-MVD fills a key research gap by providing a more resilient and efficient framework for federated recommendation systems in privacy-sensitive and data-diverse e-commerce environments.\",\"container-title\":\"Scientific Reports\",\"DOI\":\"10.1038/s41598-024-81278-1\",\"issue\":\"1\",\"journalAbbreviation\":\"Scientific Reports\",\"title\":\"Federated Cross-View E-Commerce Recommendation Based on Feature Rescaling\",\"volume\":\"14\",\"author\":[{\"family\":\"Li\",\"given\":\"Ruiheng\"},{\"family\":\"Shu\",\"given\":\"Yuhang\"},{\"family\":\"Cao\",\"given\":\"Yue\"},{\"family\":\"Luo\",\"given\":\"Yiming\"},{\"family\":\"Zuo\",\"given\":\"Qiankun\"},{\"family\":\"Wu\",\"given\":\"Xuan\"},{\"family\":\"Yu\",\"given\":\"Jiaojiao\"},{\"family\":\"Zhang\",\"given\":\"Wenxin\"}],\"issued\":{\"date-parts\":[[\"2024\"]]}}},{\"id\":543,\"uris\":[\"http://zotero.org/users/local/M0u71wYg/items/FKLR62K3\"],\"itemData\":{\"id\":543,\"type\":\"article-journal\",\"abstract\":\"With rising concerns about privacy, developing recommendation systems in a federated setting become a new paradigm to develop next-generation Internet service architecture.  used is to safeguard individual users to ensure that they cannot be distinguished individually even in an
aggregate analysis. However, by employing these privacy safeguarding strategies one willingly introduces im
balance in the performance of the federated players. A case in point would be the organizations that are le
ss engaged by users since with diminished noise the entities will be less impacted and similarly, their fun
ctioning will compare to bigger entities. It is also probable that all organisations that have exposure to
heavy amounts of user feedback are likely to experience a decrease in recommendation accuracy, as the amoun
t of noise introduced to the system to guarantee privacy will deteriorate, and will hide valuable behaviour
al predictors within the datasets the organisation is provided. (Z. Chen et al., 2022b; Dong et al., 2023;
R. Li et al., 2024a; Z. Li et al., 2023a; Upreti et al., 2024; X. Wang et al., 2022a)",

}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Privacy a
nd utility: this is tricky contact which requires application of a multidimensional observation of federate
d recommendation systems. The privacy mechanisms cannot be simply judged in terms of their efficiency becau
se it is as well crucial to deeply examine them in the area of fairness. It has to target the assurance tha
t privacy protecting practices are favourable to all the categories of user, regardless of the extent of th
eir involvement, and the depth of information they consume no matter how minimal. This is essential in maki
ng sure that no cases of over-benefits or wrongful harming of some groups of users or organisations are pre
sent. In other words, the challenge lies in ensuring that the privacy assurance is provided, and at the sam
e time, the utility and equity of recommendations are not undermined to the stakeholders of the federated e
cosystem. (M. Ali et al., 2025; Arafat, 2025a; Arcolezi et al., 2025a; Baumgartner et al., 2024; Choudhury

}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Privacy a
nd utility: this is tricky contact which requires application of a multidimensional observation of federate
d recommendation systems. The privacy mechanisms cannot be simply judged in terms of their efficiency becau
se it is as well crucial to deeply examine them in the area of fairness. It has to target the assurance tha
t privacy protecting practices are favourable to all the categories of user, regardless of the extent of th
eir involvement, and the depth of information they consume no matter how minimal. This is essential in maki
ng sure that no cases of over-benefits or wrongful harming of some groups of users or organisations are pre
sent. In other words, the challenge lies in ensuring that the privacy assurance is provided, and at the sam
e time, the utility and equity of recommendations are not undermined to the stakeholders of the federated e
cosystem. (M. Ali et al., 2025; Arafat, 2025a; Arcolezi et al., 2025a; Baumgartner et al., 2024; Choudhury

}],\"schema\":\"https://github.com/citation-style-language/schema/raw/master/csl-citation.json\"} Privacy a
nd utility: this is tricky contact which requires application of a multidimensional observation of federate
d recommendation systems. The privacy mechanisms cannot be simply judged in terms of their efficiency becau
se it is as well crucial to deeply examine them in the area of fairness. It has to target the assurance tha
t privacy protecting practices are favourable to all the categories of user, regardless of the extent of th
eir involvement, and the depth of information they consume no matter how minimal. This is essential in maki
ng sure that no cases of over-benefits or wrongful harming of some groups of users or organisations are pre
sent. In other words, the challenge lies in ensuring that the privacy assurance is provided, and at the sam
e time, the utility and equity of recommendations are not undermined to the stakeholders of the federated e
cosystem. (M. Ali et al., 2025; Arafat, 2025a; Arcolezi et al., 2025a; Baumgartner et al., 2024; Choudhury
